AttaBoxTM

A BRAND OF **ROBROY** ENCLOSURESTM

ATTABOX INDUSTRIAL ENCLOSURES

Proven Protection By Design

*The Reason You Buy Enclosures: **Protection.***

*The Reason You Should Buy AttaBox Enclosures: **Proven Protection.***

Many factors might influence your purchase of an enclosure, but all relate to the ultimate need for an enclosure to reliably protect whatever you put inside.

Whether your enclosure is intended to house an electrical connection, or a control panel, or sensitive measurement systems, the demand for uncompromised protection against diverse forces—including moisture, dust and dirt, ultraviolet radiation, temperature extremes, and impact—is the number one reason to put your trust in ATTABOX.

Get the protection you paid for.

AttaBox Enclosures: Designed to Match the “Right” Enclosure to the Exacting Performance and Protection Needs of Your Specific Job.

Every application is different.

Not every enclosure is best for every use.

AttaBox offers you freedom-of-product-choice with a wide-ranging selection of non-metallic enclosures featuring ten full product lines encompassing over 150 different sizes and 4 configurations.

AttaBox produces enclosure families representing the varying benefits of polycarbonate, fiberglass, and polyester, ensuring breadth and depth in your ability to source and achieve protection for every on-the-job need.

General Information

Standards

Application

The products in this catalog are designed for electrical and electronic enclosure applications in commercial or industrial locations that are classified as non-hazardous. Information on the classification of hazardous and non-hazardous locations appears at the end of this section.

The enclosure products in this publication should be applied, installed and used only by qualified engineers, technicians or electricians knowledgeable of the standards, laws, regulations and ordinances associated with the respective application. The information in this section has been condensed from several references and is provided for guidance in selecting the appropriate enclosure for an application. The original reference must be consulted for detailed information.

Industry Standards

The following information is provided with permission of the respective organizations to assist in the selection of an enclosure:

Enclosure Ratings

What are Ratings?

As a way of standardizing enclosure performance, organizations like NEMA, UL, CSA and IEC use rating systems to identify an enclosure's ability to resist external environmental influences. These influences include falling dirt or liquids, hose directed water to complete submersion and each are broken out by the Type rating. While these ratings are intended to assist you in your enclosure selection there are differences among the organizations.

North American Standards Organizations

In North America, NEMA, UL and CSA are the more common recognized standards organizations. Ratings between these organizations are similar in description and performance. UL and CSA both required enclosure testing that is conducted in certified labs. They also conduct site evaluations or field audits to ensure manufacturer adheres to prescribed manufacturing methods and material specifications within the approved UL/CSA files. NEMA publishes a standard for ratings and testing, but does not test or list enclosures.

International Standards Organizations

IEC does not require independent testing, similar to NEMA, but there are differences in the interpretation between the two organizations. For example, under the IEC standards for each level of ingress protection (IP), a certain amount of water is allowed to enter the enclosure. Unlike UL or CSA, water-tight means simply that. Any amount of water ingress regardless of size or amount is considered a failure to the specification.

IEC 60529 IP ratings do not specify construction or degrees of protection, while NEMA type ratings do specify construction

and performance requirements for most conditions. Because of these differences in tests and evaluations, the IEC enclosure ratings cannot be directly translated with NEMA Enclosure Type ratings.

General Information | North American Standards

NEMA, UL, and CSA Ratings

NEMA, UL, and CSA are standard writing organizations commonly recognized in North America. Their ratings are based on similar application descriptions and expected performance. UL and CSA both require enclosure testing by qualified evaluators. They also send site inspectors to make

sure a manufacturer adheres to prescribed manufacturing methods and material specifications. NEMA, on the other hand, does not require independent testing and leaves compliance completely up to the manufacturer.

Enclosure Types Non-Hazardous Location

ENCLOSURE RATING	NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA STANDARD 250) AND ELECTRICAL AND ELECTRONIC MFG. ASSOCIATION OF CANADA (EEMAC)	UNDERWRITERS LABORATORIES INC. (UL 50, UL50E AND UL 508)	CANADIAN STANDARDS ASSOCIATION (STANDARD C22.2 NO. 94)
Type 1	Enclosures are intended for indoor use primarily to provide a degree of protection against contact with the enclosed equipment or locations where unusual service conditions do not exist.	Indoor use primarily to provide protection against contact with the enclosed equipment and against a limited amount of falling dirt.	General purpose enclosure. Protects against accidental contact with live parts.
Type 2	Enclosures are intended for indoor use primarily to provide a degree of protection against limited amounts of falling water and dirt.	Indoor use to provide a degree of protection against limited amounts of falling water and dirt.	Indoor use to provide a degree of protection against dripping and light splashing of non-corrosive liquids and falling dirt.
Type 3	Enclosures are intended for outdoor use primarily to provide a degree of protection against windblown dust, rain, and sleet; undamaged by the formation of ice on the enclosure.	Outdoor use to provide a degree of protection against windblown dust and windblown rain; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use; provides a degree of protection against rain, snow, and windblown dust; undamaged by the external formation of ice on the enclosure.
Type 3R	Enclosures are intended for outdoor use primarily to provide a degree of protection against falling rain sleet; undamaged by the formation of ice on the enclosure.	Outdoor use to provide a degree of protection against falling rain; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use; provides a degree of protection against rain and snow; undamaged by the external formation of ice on the enclosure.
Type 4	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against windblown dust and rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure.	Either indoor or outdoor use to provide a degree of protection against falling rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use; provides a degree of protection against rain, snow, windblown dust, splashing and hose-directed water; undamaged by the formation of ice on the enclosure.
Type 4X	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against corrosion, windblown dust and rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure.	Either indoor or outdoor use to provide a degree of protection against falling rain, splashing water, and hose-directed water; undamaged by the formation of ice on the enclosure; resists corrosion.	Indoor or outdoor use; provides a degree of protection against rain, snow, windblown dust, splashing and hose-directed water; undamaged by the external formation of ice on the enclosure; resists corrosion.
Type 6	Enclosures are intended for use indoors or outdoors where occasional submersion is encountered. Limited depth; undamaged by the formation of ice on the enclosure.	Indoor or outdoor use to provide a degree of protection against entry of water during temporary submersion at a limited depth; undamaged by the external formation of ice on the enclosure.	Indoor or outdoor use; provides a degree of protection against the entry of water during temporary submersion at a limited depth. Undamaged by the external formation of ice on the enclosure; resists corrosion.
Type 6P	Enclosures constructed for either indoor or outdoor use to provide a degree of protection to personnel against access to hazardous parts; to provide a degree of protection of the equipment inside the enclosure against ingress of solid foreign objects (falling dirt); to provide a degree of protection with respect to harmful effects on the equipment due to the ingress of water (hose directed water and the entry of water during prolonged submersion at a limited depth); that provides an additional level of protection against corrosion and that will be undamaged by the external formation of ice on the enclosure.	Indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during prolonged submersion at a limited depth and damage from external ice formation.	Indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during prolonged submersion at a limited depth and damage from external ice formation.
Type 12	Enclosures are intended for indoor use primarily to provide a degree of protection against dust, falling dirt, and dripping noncorrosive liquids.	Indoor use to provide a degree of protection against dust, dirt, fiber flyings, dripping water, and external condensation of noncorrosive liquids.	Indoor use; provides a degree of protection against circulating dust, lint, fibers, and flyings; dripping and light splashing of non-corrosive liquids; not provided with knockouts.
Type 13	Enclosures are intended for indoor use primarily to provide a degree of protection against dust, spraying of water, oil, and noncorrosive coolant.	Indoor use to provide a degree of protection against lint, dust seepage, external condensation and spraying of water, oil, and noncorrosive liquids.	Indoor use; provides a degree of protection against circulating dust, lint, fibers, and flyings; seepage and spraying of non-corrosive liquids, including oils and coolants.

A Brief Comparison Of NEMA – “Enclosure for Electrical Equipment (1000 Volts Maximum)” and IEC 60529 – “Degrees of Protection Provided By Enclosures (IP Code)”

This publication is intended to provide a brief comparison and explanation of some of the basic differences between NEMA Standard 250, Enclosures for Electrical Equipment (1000 Volts maximum) and IEC Standard 60529, Degrees of Protection provided by Enclosures (IP Code). For a detailed comparison of the differences between the NEMA 250 and IEC 60529 performance specifications, please refer to the respective documents.

What is IEC 60529 and what does it cover?

IEC 60529 is a standard developed through the International Electrotechnical Commission (IEC) that describes a system for classifying the degrees of protection provided by an enclosure. An “enclosure” as used in 60529 is “a part providing protection of equipment against certain external influences and in any direction protection against direct contact”.

What is not covered by IEC 60529?

IEC 60529 is NOT a “product standard” and does not cover enclosure requirements other than the “degree of protection” provided. For instance IEC 60529 does not specify the corrosion protection and other environmental operating requirements and tests defined in NEMA 250.

What does “degree of protection” mean in IEC 60529?

“Degree of protection” is a term used in the standard to describe:

1. The protection of persons against access to hazardous parts inside the enclosure.
2. The protection of the equipment inside the enclosure against ingress of solid foreign objects.
3. The protection of the equipment inside the enclosure against harmful effects due to the ingress of water.

What is an “IP Code”?

The IP Code is a designation that indicates the level, or amount, of the protection. The IP Code designation consists of the letters IP (International Protection or Ingress Protection) followed by two numerals. In some instances there may be an optional letter or third digit representing protection against access and mechanical impacts. These two items are beyond the scope of this reference. Please consult additional resources as required.

What does the first numeral of an IP Code indicate?

The first characteristic numeral indicates the degree of protection provided by the enclosure with respect to persons having access to hazardous parts and with respect to solid foreign objects entering the enclosure. See Table 1.

What does the second numeral of an IP Code indicate?

The second numeral indicates the degree of protection provided by the enclosure with respect to the harmful ingress of water. See Table 2.

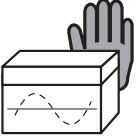

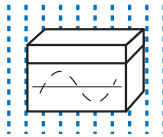

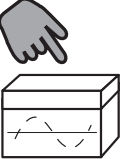

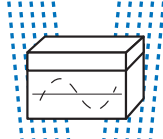

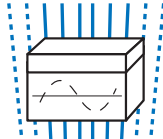

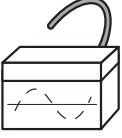

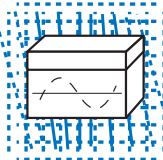

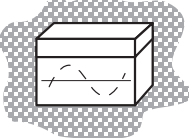

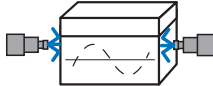

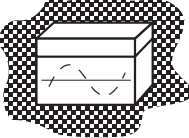

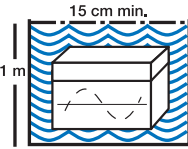

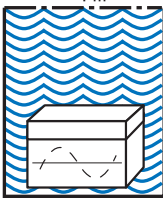

If a requirement for an enclosure Type is specified, can an equivalent IP rated enclosure be substituted?

No! The IP Code only addresses requirements for protection of people, ingress of solid objects, and ingress of water. There are numerous other requirements covered by the Type designations that are not addressed by the IEC 60529/IP Codes. IEC 60529 does not specify:

- Construction requirements
- Door and cover securement
- Corrosion resistance
- Effects of icing
- Gasket aging and oil resistance
- Coolant effects

The Type designation specifies requirements for these additional performance protections. For this reason, the IEC enclosure IP Codes designations CANNOT be converted to enclosure Type numbers. For general cross reference comparison see See Table 2.

Table 1

First Number	Protection against solid objects.	Second Number	Protection against liquids.
	0 No Protection		0 No Protection
	1 Protected against solid objects up to 50 mm e.g. accidental touch by hands.		1 Protected against vertically falling drops of water.
	2 Protected against solid objects over 12 mm. e.g. fingers.		2 Protected against direct sprays of water up to 15° from the vertical.
	3 Protected against solid objects over 2.5 mm. e.g. fingers, (tools and small wires)		3 Protected against sprays to 60° from the vertical.
	4 Protected against solid objects over 1 mm. e.g. fingers, (tools and small wires)		4 Protected against water sprayed from all directions – limited ingress permitted.
	5 Protected against dust – limited ingress permitted (no harmful deposits.)		5 Protected against low pressure jets of water from all directions – limited ingress permitted.
	6 Totally protected against dust.		6 Protected against strong jets of water e.g. for us on ship decks – limited ingress permitted.
			7 Protected against the effects of immersion between 15 cm and 1 m.
			8 Protected against long periods of immersion under water.

General Information | IP Code

Enclosure Selection Guidelines

The Enclosure Selection is designed to enhance enclosure selection by making the process easier, more consistent, accurate and complete. The goal is to assure that factors affecting enclosure selection are considered and the enclosure specification is complete and accurate.

1. Examination of the Application

The requirements of your application must be taken into consideration. Often the application will be associated with the market or product. For example, does the application require a disconnect, does it need to be wall mount or free standing? Each application is different and needs a complete review.

2. Environmental Considerations

Regardless of application - solar field, factory floor, chemical plant, the environment is a critical factor for consideration.

In the proposed environment, what is the highest threat? Based on this threat, and the use of NEMA ratings you can determine which enclosure offers the best protection.

3. Material Considerations

Based on the environmental protection that you identify, you will need to define the appropriate material for your application.

- Fiberglass*
- Polycarbonate*
- PVC*
- ABS*
- Carbon Steel*
- Stainless Steel*
- Aluminum*

4. Size Considerations

Several factors will need to be evaluated when specifying the size of the enclosure, such as:

- Internal equipment dimensions*
- Service connections*
- External space restrictions*
- Mounting and access*
- Climate control requirements*
- Aesthetics*
- Economics*

5. Standards or Ratings

Select an enclosure that has a rating appropriate for your environment and application. Rating types from NEMA, UL, CSA, and IEC determine an enclosure's ability to withstand environmental conditions. Keep in mind that there may be multiple enclosures that meet the ratings which may be reduced by material and size considerations.

6. Thermal Considerations

To maximize the life and efficiency of internal components effective thermal management considerations need to be evaluated. One often thinks in terms of dissipating heat build-up, but one must also consider applications that require addition of heat.

General Information

Hazardous Locations

Classification of Hazardous Atmospheres

The NEC classifies areas according to the nature, likelihood and extent of ignitable flammable hazards that could exist where electrical equipment is installed. The intent of area classification is to prevent fires and explosions that could be caused by electrical equipment serving as an ignition source (arc, spark, high temperature, etc.).

The NEC divides the atmospheric explosion hazards into three classes. Considerable skill and judgment must be applied when deciding to what degree an area contains hazardous concentrations of vapors, combustible dusts or ignitable fibers

and flyings. Factors such as temperature, barometric pressure, humidity, ventilation, quantity of release, distance from the source, etc. must all be evaluated.

An abbreviated summary of the NEC classifications appears in the table below. For detailed information on specific atmospheres, refer to the NEC, Articles 501-505 and 511-517. For a more complete list of flammable liquids, gases and solids; refer to NFPA 497A and NFPA 497B, Classification of Gases, Vapors and Dusts for Electrical Equipment in Hazardous (Classified) Locations.

SUMMARY OF HAZARDOUS ATMOSPHERES

CLASS	DIVISION	GROUP	TYPICAL ATMOSPHERE, IGNITION TEMPERATURES
I Flammable Gases, Vapors Flammable and Combustible Liquids	1 Normally hazardous – Always present in atmosphere	A	Acetylene, 305°C (581°F)
		B	Hydrogen, 520°C (968°F)
		C	Ethylene, 450°C (842°F)
		D	Methane, 630°C (999°F)
	2 Not normally hazardous – May be present in atmosphere	A	Same as Division 1
		B	Same as Division 1
		C	Same as Division 1
		D	Same as Division 1
II Combustible Dusts	1 Normally hazardous – Always present in atmosphere	E	Combustible metal dusts, or other combustible dusts of similar hazardous characteristics
		F	Combustible carbonaceous dusts
		G	Combustible dusts not included in Group E or F, includes flour, grain, wood, plastic & chemicals
	2 Not normally hazardous – Always present in atmosphere	F	Same as Division 1
		G	Same as Division 1
	III Ignitable fibers and flyings	1 & 2	No Groups

General Information | IP Code

IEC methodology was added to the 1996 NEC in Article 505. The IEC uses area classifications similar to the NEC, but with different terms, groupings, descriptors and temperature range. Article 505 defines only Class I areas; however, the divisions and groupings are different as shown in the following tables:

IEC Group I is for underground mines and is not covered by the NEC. Group IIC combines NEC Groups A and B making the requirements for acetylene the same as for hydrogen and other highly flammable gases.

COMPARISON OF GROUPS	
NEC Group	IEC Group
A	IIC
B	IIC
C	IIB
D	IIA

The IEC divides NEC Division 1 into Zone 0 and Zone 1. In Zone 0 the hazard is present at all times or for long periods of time. In Zone 1 the hazard is present during normal conditions, including repair and maintenance activities or leakage, or where operations or processes could result in the release of a flammable mixture or cause a simultaneous failure of electrical equipment.

COMPARISON OF DIVISIONS WITH ZONES	
NEC Division	IEC Zone
1	0
1	1
2	2
Non-hazardous	Non-hazardous

CAUTION: These methodologies are mutually exclusive and should not be mixed and matched. Equipment approved for the NEC classifications may be used in the equivalent IEC area, but not vice versa. NEC Article 500-3 requires that the area classification, wiring and equipment selection be under the supervision of a qualified Registered Professional Engineer.

Enclosure ratings for hazardous locations include:

- NEMA 7** Enclosures constructed for indoor use in hazardous locations classified as Class I, Division 1, Groups A, B, C or D as defined in NFPA 70.
- NEMA 8** Enclosures constructed for either indoor or outdoor use in hazardous locations classified as Class I, Division 1, Groups A, B, C and D as defined in NFPA 70.
- NEMA 9** Enclosures constructed for indoor use in hazardous locations classified as Class II, Division 1, Groups E, F or G as defined in NFPA 70.
- NEMA 10** Enclosures constructed to meet the requirements of the Mine Safety and Health Administration, 30 C. F. R., Part 18.

ModRight™ Services

AttaBox Enclosures prides itself in its willingness and ability to meet the enclosure modification needs of customers. The combination of technologically advanced equipment and a sound procedure for handling the most detailed modification allows AttaBox Enclosures to process modifications on time, and to the highest quality standards in the industry.

Modifications can be mixed and matched in an endless number of combinations. They can take the form of:

- Custom mold-in colors
- Silk screening
- EMI/RFI shielding
- Custom window sizes
- Custom cutouts/holes
- Custom size enclosures
- Other special requests

This AttaBox catalog is devoted to practical applications and solutions to enclosure problems. A variety of off-the-shelf products are available to solve common industry related problems. AttaBox's ModRight Program is designed to support you in very uncommon or complex applications. When you need to pick up the phone for additional assistance, think AttaBox ModRight!

ModRight

The ModRight program is multi faceted and designed to meet a range of unique requirements from simple hole drilling to full custom blend of molding materials.

DesignRight

The DesignRight Program will take your custom concept, perhaps your embossed logo or a completely custom cover design, and conform it to an existing enclosure. The result is your custom cover on a "standard" base.

FormRight

The FormRight Program is available for custom material formulation to match your unique requirements. AttaBox will work with you to custom formulate the sheet molding compound with the attributes that you require for UV, flame retardation, infestation resistance, you name it.

ProRight

The ProRight Program offers the capability of prototyping a unique design through the hand layup process or low volume molding. Product can be pre-tested for its effectiveness before large volumes of product are produced.

BuildRight

The BuildRight Program offers a complete range of standard and unique modifications that make a useful configuration right out of the carton available.

The BuildRight Program accommodates custom manufacturing and component assembly to deliver exactly the configuration that you desire at time of shipping.

CostRight

The CostRight Program will help you determine beforehand how cost effective the pre-assembly can be. Prices are agreed to up front at an industry competitive rate.

ShipRight

The ShipRight Program evaluates current shipping requirements and offers "when-needed" and on time deliveries in an agreed upon manner. Bulk shipping and quantity requirements are considered under this program.

This is the total package

From the basic product through all of its custom/modified required changes, to the moment it arrives at your doorstep for installation into your application, AttaBox ModRight Program offers standard and custom assistance for your every need. To receive a quotation or further information, please visit us at AttaBox.com.

Heartland™ Series

Proven Protection From Reliable Material Performance In Aggressive Environments

The **Heartland** (AH) Series are high performance, polycarbonate enclosures applicable for heavy industrial conditions, but with a refined style suitable for commercial, industrial and OEM design applications.

The polycarbonate resin in the **Heartland** Series attained the best available “F1” rating, having passed critical tests for UV exposure and water immersion.

Heartland Series enclosures are rain-tight and watertight rated for use in both interior and exterior applications. Material ratings, as well as product ratings, assure the user that polycarbonate is designed to perform, without adverse affects, in cold weather applications.

Of significant protective value: corrosion-resistant polycarbonate can be effectively used across a wide range of aggressive environments.

HEARTLAND SERIES ATTRIBUTES

- Latches and hinges do not penetrate enclosure
- Easy to remove lid
- High performance inserts
- Integrated padlock hasp
- Flush-fit side mount swing panel and DIN rail system
- Molded in bosses
- Multi-directional mounting feet
- Available in standard opaque or clear cover options

HEARTLAND SERIES INDUSTRY STANDARDS

UL/cUL File #	E319779
NEMA Ratings (UL508A, UL50 & UL50e)	1, 3R, 4, 4X, 6P, 12

Commander™ Series

Proven Protection From A Complete Environmental Seal

FIBERGLASS OPTION:

Commander (CO) Series slim-line enclosures are designed from fiberglass-reinforced polyester and feature a continuous polyurethane gasket that provides the critically reliable, long-term protection of a complete environmental seal.

POLYCARBONATE OPTION:

The Commander Series offers an all-polycarbonate product with blank covers and a choice of one-or-two-hole pushbutton openings for both 22mm and 30mm hardware. These enclosures include the external flush wall design, unobstructed sidewalls internally, polymer cover screws, watertight seal and other standard features of the Commander Series.

Commander Series enclosures, in a full range of sizes, are ideal for compact or portable control or simply as a small junction box.

Commander Series Fiberglass Enclosures are available in two cover versions:

The first style is a flush cover for unobstructed enclosure sides and a continuous cover gasket producing a watertight seal. Attributes include soft, rounded edges and virtually no pocket areas to trap dust or debris. These enclosures feature a mounting foot option versus bosses for a mounted back panel.

The second style offers a lift-off overhang cover design with molded-in panel mount inserts.

Both versions of the Commander Series enclosures feature a slim style with flush sidewalls. Both also include captive stainless steel cover screws.

COMMANDER SERIES ATTRIBUTES

- Memory retaining continuous polyurethane gasket
- Captive stainless steel cover screws on fiberglass option
- Captive polymer cover screws on polycarbonate option
- Chemically resistant fiberglass reinforced polyester or polycarbonate
- Submersible, non corrosive, environmental design
- High impact resistance

COMMANDER SERIES INDUSTRY STANDARDS

BantamBox™ Series

Proven Protection When “Small Is A Big Advantage!”

BantamBox is a polycarbonate enclosure series in either opaque (BB) screw cover or clear (BBCC) screw cover versions.

The flush sides of the enclosure make it a sought-after OEM design product. Raised bosses accommodate back panel mounting and are successfully used for remote sensor mounting and small electronic controls in any environment.

These modular enclosures offer a broad range of 72 sizes and are ideal as project boxes in both their opaque and clear forms.

BANTAMBOX SERIES ATTRIBUTES

- Available in 2 cover options
 1. Opaque Cover
 2. Clear Cover
- Multiple depths available in most sizes
- Resistant to harsh environments
- Flush sides for that perfect fit
- Multiple molded in bosses for a variety of mounting solutions

BANTAMBOX SERIES INDUSTRY STANDARDS

UL/cUL File #	E319779
NEMA Ratings (UL508A, UL50 & UL50e)	1, 3R, 4, 4X, 12

DuraShield™ Series

Proven Protection Because Of Simplicity In An Extremely Rugged Design

DuraShield (DU) Series enclosures are designed for rugged, durable performance in both commercial and industrial indoor and outdoor environments such as mining, oil, gas, wastewater treatment, and petro-chem.

This fiberglass-reinforced polyester product was developed with a low profile design and shallow depth. A simplified mounting system accommodates a direct-to-wall mounting, leaving unobstructed top, bottom and sides for dense mounting requirements.

Because of their pleasing aesthetics and flush cover design, **DuraShield** Series enclosures are highly valued in high-end electronic applications such as wireless communications and operator interfaces. A poured-in-place polyurethane gasket ensures a rain-tight, water-tight and submersible rating.

DuraShield Enclosures are an exceptional blending of stylistic beauty and rugged endurance.

DURASHIELD SERIES ATTRIBUTES

- 14 sizes available
- Size range from 3" x 3" to 24" x 16"
- Flat cover with captive cover screws
- DIN rail mounting capabilities
- No sidewall obstructions, flush cover
- Aluminum back panels available for all sizes

DURASHIELD SERIES INDUSTRY STANDARDS

UL/cUL File #	E64358

Freedom™ Series

Proven Protection Made Possible By The Freedom To Design For Your Individual Application Needs

Freedom (FR) Series enclosures are developed for maximum design flexibility and pleasing aesthetics. These attractive yet highly durable enclosures fiberglass-reinforced polyester enclosures are ideal for diverse applications including: high-end electronics, OEM housings and conspicuous industrial applications, both indoors and out. They can be relied on for protection in corrosive environments where a full seal against the outside environment is critical and a watertight seal is a must.

A unique benefit of feature-laden **Freedom** Series enclosures is the internal panel management system empowering the end user to select and use only the features required for their specific application --- and to use every cubic inch of valuable internal enclosure space!

The **Freedom** Series offers an additional feature of panel mounting in the cover for use as an operator interface in industrial equipment control stations.

FREEDOM SERIES ATTRIBUTES

- Available in 2 cover options:
 1. *Opaque cover*
 2. *Flush bonded window*
- Maximum visibility to raised panels and control devices
- High temperature, flame retardant, non corrosive, environmental designs
- Stands up to an exceptionally broad range of chemical exposures
- Results in an environmentally sealed, environmentally sound space
- High impact resistance
- Double insulated material No incidental electrical contact
- Solid construction in a lightweight design
- UV Resistant

The Design Difference... Unsurpassed Panel Management System®

AttaBox's innovative "Freedom" Panel Management System® enables Freedom users to take maximum advantage of ALL enclosure space...including the inside of the cover!

- Back Panel
- Variable Height Stationary Panel
- Variable Height Swing Panel
- Dead Front Swing Panel
- Cover Panel

The Freedom Panel Management System® Offers Many Benefits:

- Full utilization of both space and design. All space within the enclosure can be accessed and utilized with minimal requirements for additional mounting hardware.
- Panel maneuverability at both the time of assembly and in actual field use.
- Optimized use and function of all usable space within the enclosure while assisting in the mounting of cover mounted devices, such as touchpads and printed circuit boards.
- Maximized visibility of panels that offer critical feedback, such as instrumentation, while preserving the integrity of the enclosure.
- Ability to meet unique visual requirements usually associated with a dead front panel.
- Ability to meet the needs for mounting surface at rear of enclosure.
- Ability to meet end users' design capabilities and field changes that would otherwise require major modification or costly disassembly.
- Ability to externally assemble, then "drop in" to the enclosure DIN rail mounted components, thereby minimizing assembly, modification and field servicing.
- Maximum surface area for pushbutton or touchpad layout. Maximizes end users' design possibilities.
- Ability to meet end users' requirements for the installation of isolated visibility or custom visual requirements.
- Offers restricted access to areas of adjustment and calibration.

Go from This!...

...To This!

Freedom | Panel Management System

BACK PANEL

- Traditional sized back panel
- Common industry mounting footprint
- Wide choice of material

DEAD FRONT SWING PANEL

- Mounts at the front of the enclosure
- Larger surface area when compared to the variable height swing panel
- Hinged on one side, secured to the other
- Used in conjunction with corner mounting posts

VARIABLE HEIGHT STATIONARY PANEL

- Mounts at any height in the enclosure base including as back panel or use as a top stationary dead front panel
- Larger panel area than traditional back panels maximizes surface mounting area
- Used in conjunction with corner mounting posts

VARIABLE HEIGHT SWING PANEL

- Mounts at any height in the enclosure base
- Hinged on one side, secured to the other
- Used in conjunction with corner mounting posts

COVER PANEL

- Stationary panel that mounts to the inside of the enclosure cover.

USE MULTIPLE PANELS

Unique. Reliable. Flexible. Revolutionary. It's What You Want It To Be!

Just imagine ... an enclosure system that truly can be what you want...and need...it to be!
 Today, that enclosure system is a reality...with **Freedom**, from AttaBox.

The revolutionary design of **Freedom** provides a one-of-a-kind enclosure architecture that can range from "bare bones" basic yet durable simplicity to a highly customized, sophisticated protective structure.

Centurion™ Series

Proven Protection That Balances Aesthetics With Physical Performance

Centurion (CE) Series fiberglass-reinforced polyester enclosures have been designed for general electrical and electronic applications, as well as industrial and OEM applications requiring broader protection from environmental forces. They offer a unique feature provided by a hidden hinge design and flush fitting cover, making **Centurion** Series enclosures ideal for applications such as control stations and operator interface units in both MRO and OEM environments.

These enclosures, with their smooth, rounded edges and contemporary aesthetics, enhance the appearance of any instrument installation. They are especially well suited for applications with prominent visibility in both industrial and commercial applications.

Of equal importance, **Centurion** Series enclosures are truly tough and durable in the most demanding uses. Both chemical resistance and watertight capabilities make them ideal across a broad spectrum of environmental installations.

CENTURION SERIES ATTRIBUTES

- Available in 2 cover options:
 1. Opaque cover
 2. Flush bonded window
- Stands up to an exceptionally broad range of chemical exposures
- High impact resistance
- Double insulated material. No incidental electrical contact
- Hidden hinge design
- UV Resistant
- Soft edge design, smooth lines, flush cover
- Super abrasion-resistant acrylic window
- High temperature, flame retardant, non-corrosive, environmental designs

CENTURION SERIES INDUSTRY STANDARDS

UL/cUL File #	E64358
NEMA Ratings (UL508A, UL50 & UL50e)	1, 3, 3S, 4X, 12
CSA Std. C22.2 File #	LR069014
UL 1741 File #	E333478
Temperature Range	(-76°F to +274°F) (-60°C to +134°C)
Flammability Rating	UL94-5V
Self Extinguishing	Non-Halogenated, Non-flame propagating
NFPA No. 101 Flame Spread	Class A (1)
Certifications	UL, CSA, CE, REACH, RoHS
Outdoor UV Exposure (UL 746C)	(f1) Rated
Chemical Resistance	See chart on page 100

MachoBox™ Series

Proven Protection From Designed-In Strength

MachoBox (M) Series enclosures are expanded-size junction boxes made of fiberglass-reinforced polyester, featuring integral mounting flanges and designed to be tough, tough, tough!

MachoBox enclosures are ideal for rugged outdoor environments but also very suitable for indoor mountings where chemical wash-down, dust and aggressive atmospheres are natural threats to all enclosures.

A standard overhang cover design is available in a hinged with padlock configuration. All sizes are 20" or greater in length and width. Threaded brass inserts for fixed rear panel mounting are standard as is a continuously poured polyurethane gasket to ensure a full, reliable environmental seal.

MACHOBOX SERIES ATTRIBUTES

- Overhang cover on smooth sided base
- High temperature, flame retardant, non-corrosive
- All stainless hardware latches and screws
- Full length stainless steel hinge
- Chemically resistant fiberglass reinforced polyester
- Submersible, non corrosive, environmental designs
- Continuous polyurethane gasket

MACHOBOX SERIES INDUSTRY STANDARDS

Triton™ Series

Proven Protection When “Big Is Better!”

Triton (T) Series enclosures are used where heavy industrial equipment needs protection. These fiberglass-reinforced polyester enclosures are ideal for the mounting of high voltage electrical systems where wiring needs sufficient bend radius to enter the cabinet. They are perfect for applications involving diverse environmental conditions. **Triton's** rating is built to meet rugged construction requirements and offer protection against falling rain and sleet and remain undamaged by external ice formation. Integral mounting feet enable easy installation.

In addition to wall mounted control enclosures, the **Triton** Series offers large and freestanding enclosures. These are dimensionally large enclosures (48 x 36 to 90 x 72). The **Triton** Series has been designed for use in larger industrial control systems and machine tool control panels. They provide a rugged cabinet for use in both indoor and outdoor applications and across a range of difficult environments. These larger size wall mount or freestanding enclosures are designed for the maximum available space for electrical, hydraulic, or mechanical control circuits.

The **Triton** series is used in a daunting range of environmental conditions. A high level of protection is required in conditions involving water, chemical wash-down, wind-blown dust, rain, sleet and external ice formation. An aggressive sealing system is used to meet these rigorous demands. **Triton's** stainless steel hinged, latched down cover series is a natural choice for process control where moisture or chemical environments require unique protection.

TRITON SERIES ATTRIBUTES

- Available in 2 cover options:
 1. Opaque cover
 2. Flush bonded window
- Fiberglass reinforced polyester material
- Memory retaining polyurethane gasket
- 304 series stainless steel hardware
- Integral mounting feet
- Molded in panel mounting inserts or studs
- High temperature, flame-retardant, non corrosive, environmental designs
- Wall mount or free standing configurations

SS HINGED, LATCHED DOWN COVER

CONSTRUCTION

Material (Box & Cover)	Hand Lay-up Molded Fiberglass Reinforced Polyester (Thermoset)
Gasket	Neoprene
Back Panel Screw Size	#3/8-16 Stud
Hinge and Latch Hardware	304 Stainless Steel
Soft Edge Design	Rounded Edges, Minimal Protrusions Or Exposed Pocket Areas

INDUSTRY STANDARDS

UL/cUL File #	E64358
NEMA Ratings (UL508A, UL50 & UL50e)	1, 3, 3R, 4X, 12
CSA Std. C22.2 File #	LR069014
IEC 60529 Ratings	IP66 per UL File# E362920
UL 1741 File #	E333478
Temperature Range	(-76°F to +274°F) (-60°C to +134°C)
Flammability Rating	UL94-5V
Self Extinguishing	Non-Halogenated, Non-flame propagating
NFPA No. 101 Flame Spread	Class A (1)
Impact Rating	IK10
Certifications	UL, IEC, CSA, REACH, RoHS
Outdoor UV Exposure (UL 746C)	(f1) Rated
Chemical Resistance	See chart on page 100

General Accessories

Robroy enclosures are created in standard forms and shapes, but the ability to customize into unique end user configurations may be the single best reason to buy **Robroy** products. Certain accessories are available by part number and can be added at the time of the enclosure purchase, or added later as a separate item.

By comparison, modifications are considerably more complex and end user specific and they must be implemented before the enclosure leaves the factory. All items listed as **Accessories** are available as separately priced items.

Breather Vent – 4X

Robroy's non-metallic Breather Vent allows an enclosure to "breathe" – literally allowing the free passage of air while maintaining UL Type 4X enclosure integrity as a recognized component.

CATALOG NUMBER
REBV4XKIT

Drain Vent – 4X

Robroy's new non-metallic Drain Vent reliably protects electrical equipment housed inside an enclosure by properly draining unwanted moisture or accumulated water from within, while maintaining UL Type 4X enclosure integrity as a recognized component.

REDV4XKIT

Pluggit!®

- Superior corrosion resistance compared to rust-prone carbon steel and other metallic alternatives helps ensure increased enclosure life expectancy.
- Cost effective when compared to either carbon or stainless steel alternatives.
- Considerably better long-term resistance to UV degradation versus UV-susceptible soft rubber plugs that turn brittle from extreme temperature variations and repeated UV exposure.
- Will not create galvanic corrosion associated with dissimilar metals sometimes used in electrical enclosures.
- Maintains all chemical resistance features of current AttaBox products.
- Flame retardant material to UL 94V-0.
- A submersion/hosedown rated component for use in electrical enclosures UL recognized to type 4X and 6P.
- IEC tested to IP66 and IP68.
- Temperature Rating: -26°F to +257°F (-32°C to +125°C)

General Accessories

Nylon Cord Grip Fittings

Nylon cord grips are durable and easy to install. The body and sealing nut are manufactured with a tough, impact resistant nylon. Together the nut and washer form a positive sealing grip when installed through an enclosure wall. The oil resistant neoprene grommet and nylon washer fit tightly around an entrance cord, sealing out moisture, dust and foreign materials.

Technical Information

Enclosure Materials

The choice of material is dependent on the concentration of various corrosives present in the application environment and other physical properties necessary to meet the design specifications.

To begin the selection process, one must consider the general atmosphere as well as the corrosive agents which can be present in an application. Defining the corroding agents and determining the concentration can be a complex process. Usually several corrosive elements are present and interactions are not always well documented.

Water (and water states such as ice, snow, mist, fog, vapor) is the most common corrosive and is usually present to some extent in every enclosure application. Each environment is unique and all possible corrosive agents should be identified for the intended enclosure application.

To select the best enclosure material for an application; chemical resistance, physical strength and economic data are presented in several tables beginning on the next page. In Table 1 enclosure materials are rated on a continuum from "Recommended" to "Limited" or "Unacceptable" in three

broad categories of chemicals. Since the chemical resistance categories in the table are extremely broad, some materials may perform well in specific corrosive environments within a general category and it is best to consult the detailed Chemical Resistance Information provided in Table 3.

Besides the enclosure material, the corrosion resistance of windows, gaskets, latches, etc. must also be considered. Table 4 provides corrosion resistance information that can be used to select the commonly used materials for these features.

Much of the chemical resistance information in Table 3 is based on total immersion testing in the chemical for a minimum of 30 days at 72°F. Some test specimens were evaluated using procedures outlined in ASTM D 543, Test Method for Resistance of Plastics to Chemical Reagents. The information in these tables is intended as a guide only. Total immersion testing is considered quite severe and the results may not necessarily reflect the performance under actual field conditions. The user assumes responsibility for selection of the material based on the characteristics of the application environment.

Specifications for AttaBox Enclosure Back Panel Construction Materials

Carbon Steel (CS)

A low carbon, rolled steel produced by passing bar stock through a set of rolls. AttaBox CS back panels are powder coated for appearance and protection.

Aluminum (A)

A lightweight metal that quickly forms a natural oxide layer to resist corrosion. AttaBox fabricates back panels from Type 3003 H14 Aluminum, the highest strength non-heat treatable aluminum alloy recommended for marine applications.

ABS (ABS)

Acrylonitrile butadiene styrene (ABS), a polymer panel with one smooth side, and one textured side to fit your needs. The thickest panel we offer at 0.23 inch.

Enclosure Materials

TABLE 1. BROAD CATEGORIES OF ENCLOSURE MATERIAL CHEMICAL RESISTANCE			
CONTINUUM OF USE	GENERAL CATEGORY OF CHEMICALS		
	Acids	Alkalines	Solvents
↓ ↓ Recommended ↓ ↓ Acceptable ↓ ↓ Limited or Unacceptable ↓ ↓	Stainless Steel Fiberglass PC PVC Powder Coated Steel Aluminum Galvanized Steel	Fiberglass Stainless Steel PC Galvanized Steel Powder Coated Steel PVC Aluminum	Fiberglass Stainless Steel Aluminum Powder Coated Steel Galvanized Steel PC PVC

TABLE 2. RELATIVE MATERIAL STRENGTH AND COST COMPARISON OF COMMONLY USED ENCLOSURE MATERIALS				
MATERIAL	RELATIVE PHYSICAL STRENGTH	RELATIVE COST	APPLICATION CONDITIONS	TEMPERATURE LIMITATIONS
Aluminum	Average	Average	Indoor and Outdoor, Marine, Solvents, Petrochemical Sulfates, Nitrates and Specific Acids.	None for enclosure applications
Fiberglass	Average	Low - Average	Indoor and Outdoor for continuously damp and highly corrosive environments. Petrochem, Water Treatment, Food Processing, Coating, Salts and Chemicals, Solar.	-40°F(C) to 250°F(121°C) AttaBox -76°F to 274°F (-60°C to 134°C)
Mild Steel: Galvanized Painted	High	Average - Low	Indoor and Outdoor where the respective coating provides acceptable protection in a mildly corrosive environment.	None for enclosure applications.
Stainless Steel	High	Average - High	Indoor and Outdoor in highly corrosive applications. Food and Dairy Processing or Marine.	None for enclosure applications.
Acrylic	Average	Low	Enclosure Windows. Weatherable, Scratch Resistant. Good resistance to Solvents.	-31°F(-35°C) to 180°F(82°C)
Polycarbonate	Average	Low - Average	Indoor and Outdoor for continuously damp and highly corrosive environments. Water Treatment, Food Processing, Coating, Salts and Chemicals, Solar.	-31°F(-35°C) to 248°F(120°C)
Nylon	Average	Low	Cord Grip, Hinges, Latches.	-22°F(-30°C) to 212°F(100°C)
Gaskets: Neoprene Silicone Urethane	Low Low Low	Low Average Average	Oil Resistance. Seams may be a problem Oil Resistance Temperature & Chemical Resistance. Water and Oil Resistance, Chemical Resistance.	-40°F(C) to 225°F(107°C) -40°F (C) to 350°F(175°C) -40°F(C) to 200°F(93°C)

Detailed material strength information is beyond the scope of this catalog and should be obtained from a materials reference; however, Table 2 provides some relative data to help with this selection.

Technical Information

Chemical Resistance – Enclosure Material

KEY:

- S** = Superior Resistance/Completely Unaffected under all Conditions
- L** = Limited Resistance, Some Chemical Attack May Occur Over Time
- M** = Moderate Resistance, Superficial Effects only, Testing Recommended
- U** = Unsatisfactory, Severe/Chemical Attack in a relatively short time
- = No Data Available

AttaBox offers no guarantee or warranty as to the applicability of this chart on a particular situation as the actual conditions of use on our enclosures are beyond our control.

Non-Metallic Properties

Enclosure Weight Load Capacity

Large control enclosures 20" x 16" and above can support 200 lbs. of equipment on the back panel. Smaller-junction enclosures 18" x 16" and below should be limited to 75 lbs. Listed values assume the enclosure is vertically mounted against a reasonably flat surface and are based on a minimum safety factor of two.

Sunlight (UV) Resistance

In time sunlight may affect enclosure surface, but its electrical and mechanical properties remain unaffected. Surface roughening or discoloration caused by UV exposure is a common phenomenon encountered with all non-metal products, but it only affects surface appearance. Tests have confirmed the effect on polyester fiberglass is only 40 to 80 microns (0.0015"-.003") in depth. If appearance is a concern, an outdoor acrylic paint (clear or pigmented) will provide protection for many years. Most acrylic paints in ordinary spray cans work well.

AttaBox fiberglass enclosures are molded using a patented material formulation (SolarGuard®) which can provide up to 60% more UV resistance.

AttaBox Polycarbonate Enclosures are molded with UV protected materials. Both fiberglass and polycarbonate are rated F1 for outdoor use.

Flammability Test Methods

UL94-HB

Test is run with bars 1/2 of an inch wide and five inches long. These are held horizontally and exposed to a flame 3/4 of an inch high. Ignition is forced until one inch of sample has burned, the flame removed and the burning rate is measured. To pass UL94-HB a sample over 1/8 of an inch thick must burn slower than 1-1/2 inches per minute, and a sample 1/8 of an inch thick or less must not burn faster than 3 inches per minute.

UL94-V0

Test is run with bars 1/2 of an inch wide and five inches long, held vertically with a flame size of 3/4 of an inch high. Each sample is ignited for ten seconds, the flame allowed to go out and ignited for a second time of ten seconds. To pass UL94-V0 the flame must be out in ten seconds or less, no glow beyond thirty seconds and no burning material can fall.

UL94-5V

This is a newer and tougher version of UL94 test. The sample size remains the same, but the flame size increases to five inches from 3/4 of an inch and number of ignitions increases from two to five, but the duration is decreased from ten to five seconds. To pass UL94-5VA the flame must be out in sixty seconds or less, no burning material can fall and the flame cannot penetrate through the test sample.

Drilling, Sawing, Cutting and Punching

Installers find non-metallic enclosures easy to cut or drill. Ordinary drills, hacksaws, hole saws and punches cut through fiberglass with little effort. Polycarbonate enclosures are best modified using ordinary drill hole saws. Punching of polycarbonate is not recommended Carbide tip tools work best for most applications.

Impact Resistance

AttaBox enclosures are quite resistant to damage caused by falling tools or flying debris. When tested in accordance with UL Standard 746C, Section 24, these enclosures withstood an impact in excess of 216 pound-inches. The test was performed by dropping a 2" diameter solid steel ball on various areas of the enclosure from a height of 15 feet. The impact force from such a test is comparable to dropping a large wrench from 3 or 4 ft.

Integrity of the enclosure was not compromised

Technical Information

Enclosure Security

Safety

Enclosures may contain the controls or elements of a control system which are crucial to the safety of many people. Control enclosures in large chemical plants, electrical generating facilities, airports, mass transit systems or hospitals can house equipment critical to the well being of numerous individuals. In these and many other applications, rigorous security requirements are designed to protect the public and prevent unauthorized or accidental operation of control equipment.

Location

If the enclosure will be installed in a fenced area, within a building or in other secure areas, the security requirements will be affected. The selection of latches and hinges can be influenced by the location of adjacent equipment or other enclosures.

Appearance

Enclosure appearance can be influenced by both hinges and latches. Some enclosures are designed with hidden hinges and quarter turn latches to make these features less prominent.

Hinges & Latches

Access frequency – daily or annually can be an important factor in specifying the type of latches. Will the location or any specifications require a tool for opening, will it require a padlock are other considerations for latches. In many cases when the enclosure is selected the hinge type is automatically selected, because the hinge is an integral part of the enclosure. For some enclosures it is possible to select the hinge or hinge less options available.

Monetary Loss

In some applications the monetary value of the equipment in an enclosure may be sufficient to justify additional security costs. In most applications, the economic consequences of unauthorized or accidental operation of a control system will be more significant than the value of the equipment.

Enclosure Temperature Control

Overview

Electrical and electronic components are continually being reduced in size allowing designers to place more equipment in a smaller space. This concentration of equipment generates higher internal temperatures and makes heat dissipation very important. Overheating causes electrical insulation to deteriorate and shortens the life of electrical and electronic components. As a rule of thumb, for every 18°F (10°C) above room temperature (72°F or 22°C) an electronic device operates, its life expectancy is reduced by 50%

Enclosure Materials

The following information applies to gasketed and unventilated enclosures. Exterior surface finishes significantly influence temperature rise. Fiberglass, polycarbonate, and painted steel enclosures dissipate heat better than unfinished aluminum or stainless steel enclosures because the fiberglass, polycarbonate, and painted steel surfaces are more efficient thermal radiators than the unfinished surfaces. In outdoor applications light colored enclosures such as white have a high reflectance which minimizes solar heat gain compared to dark colored enclosures.

Enclosure Surface Area

The total surface area of the enclosure directly influences heat dissipation. The larger the total surface area the lower the temperature rise will be.

To calculate the total internal surface area in sqft use the following equation:

$$\text{Surface Area} = 2[(AxB)+(AxC)+(BxC)] / 144 \text{ where the specific enclosure inside dimensions are } A \times B \times C.$$

This equation uses all six (6) sides of an enclosure. If any particular side is not available for transferring heat (example the back is mounted against a cement wall) that surface area should be subtracted from the total surface area available.

Also note, enclosure volume cannot be substituted for enclosure area.

Enclosure Heat Input

The heat generated in an enclosure varies and depends on the equipment mounted in the enclosure and the application. In order to calculate Temperature Rise, this heat input or power input must be known. This information can be obtained from the component manufacturers of components to be installed in the enclosure.

Enclosure Temperature Rise (DT)

Enclosure temperature rise is the temperature difference between the air inside a non-ventilated or cooled enclosure and the ambient air outside the enclosure. The enclosure temperature rise is independent of the ambient temperature; it is dependent on the heat generated within the enclosure and the actions taken to dissipate that heat. To establish the maximum service temperature, the temperature rise value from the graph in Figure 1, must be added to the maximum ambient temperature surrounding the enclosure.

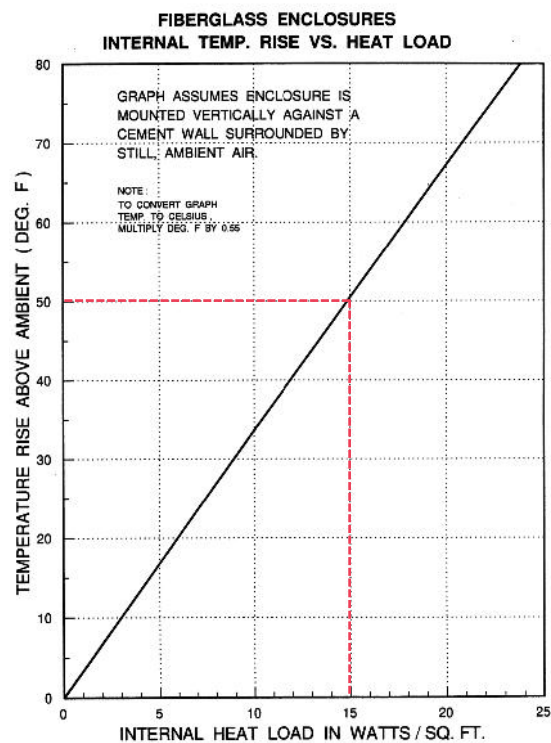

Example:

Max ambient T = 130°F

Internal Heat Load = 15 watts/sqft or 50°F estimated from Figure 1

Calculated Maximum Service Temperature = (130°F + 50°F) = 180°F

Figure 1. Internal Temperature Rise vs. Heat Load

The temperature graph was developed through empirical testing using several enclosures of various sizes. The temperatures represent an average of one temperature measurement near the bottom of the enclosure and a second measurement near the top. Electric heaters mounted equidistant from the internal surfaces of the enclosure were used as the heat source. Because hot air rises, a significant temperature gradient occurred from top to bottom. Typical of an actual installation, the top was much hotter than the bottom.

Technical Information

Enclosure Temperature Control

Influences of Heat Transfer

Convection and thermal radiation are used most often to dissipate heat from enclosures. Because polymers are a thermal insulator, a common misconception exists that non-metallic enclosures operate at significantly higher temperatures than metal enclosures. To the contrary, performance data reflect that enclosure material has little influence on the operating temperature and confirm that non-metallic and painted metallic enclosure function at nearly the same temperature with the same internal heat load. Based on these observations material thermal conductivity is not a major factor in determining heat transfer for an enclosure.

Even though the thermal conductivity of a polymer is much less than aluminum or steel, the heat transfer characteristic of non-metallic and metal enclosures are similar. Other factors such as the high thermal insulation of air contained within the enclosure along with the finish, color and total surface area of the enclosure have more influence on heat transfer than thermal conductivity. In general the finish and color of an enclosure most affect the heat transfer capability, Indoor and in outdoor applications.

Thermal conductivity is commonly measured in BTU/hr/ft²/°F/in, the K Value. K units represent the quantity of heat, which can pass through one square foot of material in one hour for every °F in temperature difference across one inch of material thickness. Larger K values indicate better heat conductivity. The K value for fiberglass is 1.68; the K value for steel is 334; the K value for aluminum is 1050, and the K value for polycarbonate is 1.3.

The heat transfer factor (Q) is measured in BTU/hr/ft²/°F or watts/ft²/°F. For the analysis in this section the Q value used for steel enclosures is 1.25 BTU/hr/ft²/°F (0.37 watts/ft²/°F); for non-metallic enclosures the Q value is 0.62 BTU/hr/ft²/°F (0.2 watts/ft²/°F). The Q value for sheet metal enclosures will vary between 1 BTU/hr/ft²/°F (0.29 watts/ft²/°F) and 5 BTU/hr/ft²/°F (1.46 watts/ft²/°F), depending on the amount of enclosure insulation.

Air as an Insulator

If metals have much better thermal conductivity, why does equipment in a polymer enclosure operate at nearly the same temperature as in metal enclosures? The air confined within the enclosure has a K value of 0.017, almost 100 times less than fiberglass specifically. The thermal resistance of the air and the enclosure wall material are in series and must be added. Because air is a superior thermal insulator compared to either polymer or steel, it is a predominant factor in establishing heat dissipation. This helps explain why equipment operates at the same temperature regardless of which enclosure material is used and also why environmental control systems heat or cool the air to control the internal temperature.

Surface Area as a Factor

Another factor, which directly influences heat dissipation, is surface area. If the enclosure surface area is doubled with a given internal heating load, the temperature rise will only be half as great. It is important to remember that surface area is not necessarily related to enclosure volume, i.e., an enclosure having twice the surface area does not always have twice the volume.

Other Related Issues

Certain applications may require the walls of an enclosure to act as a heat sink. For example, it is not uncommon to locate a high power semiconductor on the wall of a metal enclosure to dissipate heat. Non-metallic enclosures will not perform this function efficiently because the polymer walls have negligible thermal conductivity. In this application conduction is used to dissipate the heat and a fiberglass enclosure will not function the same as a metal enclosure.

Enclosure Temperature Control

Calculating Temperature Rise

Enclosure temperature rise can be approximated using the following steps and calculations:

1. Calculate the internal surface area
 - a. Some common enclosure sizes and areas are already calculated and can be found in Table 1.
 - b. Using the Enclosure Surface Area formula on page 136.
2. Determine the Input Power by dividing the expected heat load by the internal surface area.
3. Then using Figure 1, estimate the temperature rise by finding where the Internal Heat Load value intersects the line and reading the approximate temperature rise on the left vertical axis of the graph.

Note these are approximations, safety factors should be considered to minimize uncertainties.

Example

An AH1816 enclosure contains a device that generates 120 watts, calculate the internal temperature rise.

Solution

1. Surface Area = 9.1sqft (method for any size use calculation on page 136 for Internal Surface Area).
2. Internal Heat Load = $120 \text{ watts} / 9.1 \text{ sqft} = 13.1 \text{ Watts/sqft}$
3. Using Figure 1, Input Power of 13.1 intersects the diagonal line corresponds to a temperature rise of 42°F above ambient.

Technical Information

Enclosure Temperature Control

Additional Cooling Methods

When it has been determined that the heat load is too large for an enclosure to dissipate by radiation and convection, the following supplemental cooling methods are available:

Breather Vents and Louver Vents

Breather Vents and Louver Vents are designed to remove heat from the enclosure by allowing natural air circulation around the heat source and exhausting the hot air through slots or louvers. This method is relatively inexpensive and has no operating cost; however, it can only be used to dissipate a limited amount of heat and it is difficult to predict the temperature drop produced by a vent utilizing natural convection.

Circulating Fans

In larger sealed enclosures a fan can be used to circulate the air and reduce localized heat concentrations; however, the applications are limited because a closed system fan only redistributes heat, it does not dissipate the heat generated by the hot spot.

Where an enclosure does not need to be sealed from the outside environment, fans can be used to circulate air through an enclosure and dissipate the heat generated by power supplies, transformers and other heat producing equipment. Fans can provide as much as 10 times the heat transfer rate of natural convection and radiation. Once the heat input in watts/ft² is determined and temperature rise is established from Figure 1, the following equation can be used to calculate the fan flow rate:

$$\text{Fan Flow Rate (CFM)} = 3.17 \times \frac{\text{Internal Heat Load (watts)}}{\text{Temperature Rise}}$$

Example

Equipment in an T363012 enclosure generates sufficient heat to require a fan, which will dissipate 300 watts. The maximum ambient temperature in the application environment is 115°F. If the temperature of the other contents in the enclosure cannot exceed 125°F, what size is required?

The allowable temperature rise is 125°F - 115°F = 10°F. The application requires dissipation of 300 watts.

Solution

To determine the cubic feet per minute (CFM) required in a standard application, use the following equation (if the air density is significantly more than 0.075 lb. per cubic foot, a non-standard application exists and this equation should not be used):

$$\text{Fan Flow Rate (CFM)} = 3.17 \times 300 \text{ watts}/10^\circ\text{F}$$

$$\text{Fan Flow Rate (CFM)} = 95 \text{ CFM}$$

This calculation is exact, but adding an additional 25% capacity to the CFM level is standard to provide a safety factor.

$$1.25 \times \text{Fan Flow Rate (CFM)} = 1.25 \times 95 \text{ CFM} = 119 \text{ CFM}$$

If the air density is non-standard (significantly more than 1.075 lb. per cubic foot), the following equation can be used to calculate the fan capacity:

$$\text{Fan Flow Rate (CFM)} \times 0.075 \text{ lb. per cubic foot} / \text{Non-standard Air Density (lb. per cubic foot)}$$

Fans can be used to draw air through an enclosure insert, exhaust hot air from an enclosure or to draw cool air into an enclosure. An inlet fan offers the following advantages:

- Raises the internal pressure, which helps keep dust and dirt out of an unsealed or frequently open enclosure.
- More turbulent airflow improves heat transfer.
- Longer fan life with cooler incoming air.

Enclosure Temperature Control

The following considerations are important in locating a fan:

- Avoid placing transformers, power supplies or other heat generating devices in front of the fan. Although this cools the device, it increases the heat load on other devices within the enclosure. It is best to place these devices near the exhaust outlet.
- To achieve maximum cooling, the inlet and outlet should be separated by the maximum distance. If the outlet and inlet are adjacent to each other, the hot outlet air will be drawn into the inlet and cooling efficiency will be reduced. In general the inlet should be at the bottom of the enclosure and the outlet at the top.
- Fans should not be used or located in areas where the airflow is restricted. A plenum is recommended to accelerate air velocity and improve fan performance. A plenum is particularly helpful when a filter is used where airborne contaminants are a problem.
- The air outlet area should at least equal the inlet area. For best results the exhaust opening should be 1.5 times the area of the fan opening.
- Air is less dense at high altitudes. For this reason airflow should be increased in high altitude applications.
- All fans used in parallel should be identical.

Heat Exchangers - Cooling

Heat exchangers are a good option when precise control of heat and humidity are not required and the heat transfer requirements are significant. The required heat exchanger capacity can be calculated using the formula,

$$\text{Heat Exchanger Capacity (watts/}^\circ\text{F)} = \frac{\text{Internal Heat Load/DT} + 0.22 \times \text{Enclosure Surface Area}}{\text{Where DT = Temperature Rise.}}$$

Example

If the internal heat load is 1000 watts in an T603612 Fiberglass enclosure, what is the minimum cooling capacity for the heat exchanger unit? The Maximum ambient temperature is 130°F and the internal equipment will malfunction if the internal enclosure temperature exceeds 105°F.

Solution

Internal Heat Load = 1000 watts

Maximum Temperature Differential = $T_i - T_o = 105^\circ\text{F} -$

$130^\circ\text{F} = -25^\circ\text{F} = [25^\circ\text{F}]$, use Absolute Value.

Enclosure Surface Area = 48.48 ft²

Heat Exchanger Capacity =

$1000 \text{ watts}/(25^\circ\text{F}) - 0.22 \times 48.48 \text{ ft}^2 = 29.33 \text{ watts}/^\circ\text{F}$

In this example the surface area acts to cool the enclosure and is subtracted, the Absolute Temperature Value is used because this is a temperature difference.

Air Conditioning-Cooling

Air conditioning will be required in high ambient temperature locations where precise temperature control and humidity reductions are required in a sealed enclosure. Air conditioning can also be required where neither convection, thermal radiation, louvers, slots nor a circulating fan system provide adequate cooling. Because air conditioners remove moisture from the enclosure, a condensate drain is generally required.

The four-step process to size and select the air conditioner is influenced by the internal heat load, enclosure size and the application environment. The following information is required:

Step 1. Determine the Internal Heat Load

Heat generated by all sources within the enclosure shall be added together to establish the internal heat load in watts. The heat load in watts may be multiplied by 3.413 to convert to BTU/hr.

$$\text{Internal Heat Load} = \text{_____} \text{ watts} \times 3.413 \\ = \text{_____} \text{ BTU/hr.}$$

Technical Information

Enclosure Temperature Control

Step 2. Calculate the Surface Area of the Enclosure

The surface area can be calculated by using this formula.

$$\text{SURFACE AREA} = [2(A \times B) + 2(A \times C) + 2(B \times C)] / 144 \text{ IN}^2 = \text{AREA IN SQUARE FEET}$$

If the enclosure is mounted on a wall or against another enclosure, the surface area calculation may be modified as identified in Table 2.

Step 3. Establish the Temperature Differential

The temperature differential (DT) is calculated by subtracting the maximum allowable temperature inside the enclosure (Ti) from the maximum ambient temperature outside the enclosure (To).

$$T_o - T_i = DT = \text{_____} \text{ } ^\circ\text{F}$$

Step 4. Calculating the Required Air Conditioning Capacity

The values determined in the first three steps are used to calculate the required capacity of the air conditioner according to the following formula,

$$\text{Cooling Capacity (BTU/hr)} = \text{Surface Area} \times DT \times Q + \text{Internal Heat Load, where } Q = 0.62 \text{ BTU/hr/ft}^2/\text{ } ^\circ\text{F} \text{ (0.2 watts/ft}^2/\text{ } ^\circ\text{F) for non-metallic enclosures, and 1.25 BTU/hr/ft}^2/\text{ } ^\circ\text{F (0.2 watts/ft}^2/\text{ } ^\circ\text{F) for steel.}$$

Example

If the internal heat load is 500 watts in a T603612 fiberglass enclosure, which is wall mounted, what is the cooling capacity required for the air conditioning unit? The maximum ambient temperature is 125°F and the internal equipment will malfunction if the internal enclosure temperature exceeds 110°F.

$$\text{Step 1: Internal Heat Load} = 500 \text{ watts} = 3.413 \times 500 \text{ watts} = 1707 \text{ BTU/hr}$$

$$\text{Step 2: Total Surface Area} = 48 \text{ ft}^2$$

$$\text{Step 3: Temperature Difference:}$$

$$T = T_o - T_i = 125^\circ\text{F} - 110^\circ\text{F} = 15^\circ\text{F}$$

$$\text{Step 4: Air Conditioner Capacity}$$

$$48.48 \text{ ft}^2 \times 15^\circ\text{F} \times 0.62 \text{ BTU/hr/ft}^2/\text{ } ^\circ\text{F} + 1707 \text{ BTU/hr} = 2157.9 \text{ BTU/hr}$$

$$48.48 \text{ ft}^2 \times 15^\circ\text{F} \times 0.2 \text{ watts/ft}^2 + 500 \text{ watts} = 645.4 \text{ watts}$$

Air Conditioning - Heating

Some enclosure systems have minimum as well as maximum operating temperature limitations. When the equipment in an enclosure must be maintained above a minimum temperature at low ambience, these same equations can be modified and used to calculate the supplemental heat required to select and size the heaters. The only differences are that the internal heat load will help heat the enclosure and the temperature difference, DT, is calculated by subtracting the minimum ambient temperature (To) outside the enclosure from the required temperature (Ti) inside the enclosure. The minimum supplementary heat can be calculated according to one of the following equations:

$$DT = T_o - T_i$$

$$\text{Supplementary Heat} = [\text{Surface Area} \times (DT - 1)] / 4.1 \text{ or } = \text{Surface Area} \times DT \times Q \text{ where } Q = 0.2 \text{ watts/ft}^2 \text{ } ^\circ\text{F}$$

Enclosure Temperature Control

Example

If the internal heat load is 100 watts in an T603612 Fiberglass enclosure, which is wall mounted, what is the minimum heating capacity for the heating elements? The minimum ambient temperature is 0°F and the internal equipment will malfunction if the internal enclosure temperature drops below 40°F.

$$DT = T_o - T_i = 40^\circ\text{F} - 0^\circ\text{F} = 40^\circ\text{F}$$

Supplementary

$$\text{Heat} = [48.48 \text{ ft}^2 \times (40^\circ\text{F} - 1)] / 4.1 = 461.2 \text{ watts}$$

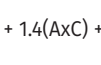

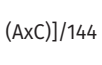

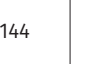

- or -

$$48.48 \text{ ft}^2 \times 40^\circ\text{F} \times 0.2 \text{ watts/ft}^2 \text{ }^\circ\text{F} = 387.8 \text{ watts}$$

Two Commonly used, but different, equations shown above have been used to show the effect of using different heat transfer values.

In addition to heating, supplementary heaters are often used in enclosures to keep the internal enclosure ambient temperature a few degrees above the ambient temperature to prevent condensation on internal equipment.

TABLE 2. CALCULATION OF ENCLOSURE SURFACE AREA DEPENDING ON LOCATION

ENCLOSURE CONFIGURATION	POSITION	FORMULA FOR SURFACE AREA
Single Enclosure, Free Standing		$[2(AxB) + 2(AxC) + 2(BxC)]/144$
Single Enclosure, Free Standing*		$[1.8(AxB) + 1.8(AxC) + 1.4(BxC)]/144$
Single Enclosure, Against a Wall		$[1.4(BxA) + 1.4(BxC) + 1.8(CxA)]/144$
Side by Side Enclosures; First or Last Enclosure in Bank of Enclosures		$[1.4(CxA) + 1.4(BxC) + 1.8(BxA)]/144$
Side by Side Enclosures; First or Last Enclosure in Bank of Enclosures Against Wall		$[1.4(AxB) + 1.4(AxC) + 1.4(BxC)]/144$
Side by Side Enclosures Not at the End of Enclosure Bank		$[1.8(AxB) + 1.4(BxC) + (AxC)]/144$
Side by Side Enclosures within an Enclosure Bank, Bank Against a Wall		$[1.4(AxB) + 1.4(BxC) + (AxC)]/144$
Side by Side Enclosures within an Enclosure Bank, Bank Against a Wall & Roof Above		$[1.4(BxA) + 0.7(BxC) + (CxA)]/144$

*Depending on the enclosure design, the complete surface area may not be exposed for cooling. This formula and the remaining ones are conservative and account for such differences.

Technical Information

Enclosure EMI/RFI Shielding

The requirements and standards for enclosure electromagnetic compatibility are continually increasing with the proliferation of electronics for industrial process control, information processing, and communication equipment. In the United States the Federal Communications Commission establishes the requirements and regulates the amount of electromagnetic interference, (EMI). Since January 1, 1996 the European Union (EU) has enforced legislation, Electromagnetic Compatibility (EMC) Directive 89/336/EEC, which regulates the amount of EMI and Radio Frequency Interference (RFI) that products can emit or must repel to function acceptably.

While the enclosure itself is not covered by these requirements, once the electronic equipment is installed within the enclosure, the package must comply with applicable EMI/RFI directives. Shielding and electromagnetic compatibility are highly specialized with their own terminology. The following definitions will help to specify EMI/RFI compatibility and select enclosures if the acronyms and technology are unfamiliar:

Attenuation A measure of the ability to contain or repel EMI/RFI energy. It can also be called shielding effectiveness and is usually expressed in decibels (dB).

Decibel (dB) Unit to express the effectiveness of a material or system in reducing electromagnetic interference. If a shielded enclosure reduces the EMI by 30 dB, the power of the interfering wave will be reduced by a factor of 1000 in passing through the enclosure. If the EMI reduction is 40 dB, the power is reduced by a factor of 10,000. The equation for calculating attenuation in decibels is $\text{dB} = 10 \log_{10} (P1/P2)$ where P1 = power of the interference wave before it passes through the enclosure, P2 = power of the wave after it has been reduced (attenuated) by the enclosure.

Electromagnetic Emission Electrical energy radiated into the environment intentionally by an antenna or incidentally by an electronic component or power equipment during a switching operation.

Electromagnetic Field Invisible fields which surround energized conductors such as wires and antennas. A field has both electric and magnetic components.

Electromagnetic Immunity The capability of an electronic component or electrical equipment to perform its intended function in the presence of external electromagnetic fields.

EMI (ElectroMagnetic Interference) Randomly radiated electrical energy which can emanate from high voltage equipment or power lines, welding equipment, switches, relays, spark plugs, or any device that generates an electric spark or corona. The random voltages or currents generated by these sources are coupled to electronic systems with undesirable results. EMI waves are not well ordered, vary widely in intensity, and cause interference over a wide frequency range. The sun is a natural generator of EMI.

EMC (ElectroMagnetic Compatibility) The ability of electronic equipment to perform its intended function in the presence of EMI and RFI disturbances without affecting proper operation.

EMP (ElectroMagnetic Pulse) Interference caused by a large and sudden electrical discharge such as lightning. EMP is short in duration but can radiate intense power. Like EMI, EMP is not well ordered and causes interference over a wide range of frequencies.

Ohms per Square A measurement unit for electrical continuity of the metal coating applied internally to non-metallic enclosures for EMI/RFI shielding. Although the coating thickness influences shielding to some extent, the electrical continuity is much more important. The conductive coating on Robroy Enclosures typically measures less than 2 ohms per square. The surface resistance (or conductivity) measurement is without units because the surface area does not influence the reading, i.e., measurements taken on a large sheet of conductive material will yield the same result over 1sq in, 1 sq. ft, 1 sq. yd., or 1 sq. meter.

RFI (Radio Frequency Interference) Interference caused by radio waves which emanate from commercial radio and television stations, amateur radio broadcasts, radar, microwave ovens, etc. Radio waves are usually well defined in terms of amplitude and frequency.

Military specification, MIL-STD-285, is used to test the shielding effectiveness of Robroy Enclosures. The procedure involves placing a transmitting antenna within the enclosure and a receiving antenna outside the enclosure. Measurements are then made alternately with the enclosure door/cover open and closed. The difference between the open and closed measurements expressed in dB is the shielding effectiveness. Measurements are usually made at 10 frequency points ranging from 0.01 to 1000 MHz.

Depending on the enclosure design and frequency of the EMI/RFI, the attenuation of a standard AttaBox non-metallic enclosure without modification will vary between 0 and 20 dB.

Robroy Enclosures interior surfaces can be coated with a highly conductive copper coating that provides excellent EMI/RFI shielding. The coating has been tested by an independent test laboratory and provides an average attenuation of 60 dB over the frequency range from 0.01 to 10000 MHz.

The coating description and properties are provided in the following table:

COATING DESCRIPTION AND PROPERTIES	
Shielding Material	Copper
Frequency Range	1-1000MHz
Sheet Resistance	< 2.5 Ohm/Square
Attenuation	>75dB

Enclosure Installation Considerations

What is Torque?

Torque is the tendency of a force to rotate an object about an axis. Just as a force is a push or pull, a torque can be thought of as a twist. Loosely speaking, torque is a measure of the turning force on an object such as a bolt. The unit of measure is generally expressed in foot pounds or inch pounds

The formula for torque is:

$$t = r \times F$$

where:

t is the torque

r = the length of the lever arm

F = the force

Properly fastened threaded products achieve their holding power from the tension (or torque) that is derived from the mating of the external and internal threads subject to the elastic limit of the material.

What torque to apply is a generally asked question, but the answer depends on the variables of material, threads' class of fit, method of thread manufacture, and thread lubrication - if any.

Table 3 is offered as the suggested maximum torque values for threaded products. The table is only a guide. Actual tests were conducted on dry, or near dry, products. Mating parts were wiped clean.

TABLE 3 – STRENGTH CHARACTERISTICS

Methods For Making Holes And Cutouts In Non-Metallic Enclosures

Drilling of non-metallic material has been difficult and, for some, a mystery. The ability to accurately drill holes in polymer material has been the subject matter of numerous articles and how to demonstrations. There are several types of machining operations that can be performed on polymers such as turning, drilling, routing, trimming, sanding, and milling. Most of these operations are similar to metal removal techniques but there are some differences that need to be addressed in order to make clean, high quality holes and cutouts in composites.

Delaminating of the outer surface or melting/strings of polymer material and glass fibers directly below the surface are the main failure modes noticed when holes or cutouts are drilled or cutout improperly. Most times excessive edge chipping around the perimeter of the cutout or hole is due to improper tools used and methods applied. Other times excessive material pulls or attached fibers not sheared off during the cutting or turning process can also cause delamination failure from the tearing action during material removal. Improper tools used and/or methods are also a culprit of this failure mode. All these can lead to downstream assembly problems, functionality problems, and become aesthetically unappealing if taken to the extreme.

The most common source of failure mode when making holes in an enclosure is a dull cutting tool. Dull tools tend to rip or tear the material. A little planning and understanding of the proper methods to machining polymers up front can make all the difference in the final outcome of the operation.

Figure A shows delamination of the surface of the part at the drill entrance.

Figure B shows similar delamination just prior to drill exit.

(Continued on the following pages)

Cutting & Drilling Continued

1. Hole Saw. The easiest and least complex method to provide an opening in a composite enclosure is to use a fine-toothed hole saw. You must first layout the size and location of the cutout, pre-drill a small hole in the center within the cutout area for the hole saw to start, and then carefully cut out the area to be removed. This is more time consuming and the least accurate method but can be accomplished in almost any environment. Keeping the saw perpendicular to the cutting surface, maintaining a consistent sawing action, and using a diamond/carbide impregnated saw or fine toothed saw will provide the highest quality cutout with minimal edge chipping.

2. Drilling, Boring. Putting round holes in enclosure walls or thru the enclosure door is the most common type of cutout. A recommended tool would be a carbide tipped or PCD diamond tipped hole saw or twist drill bit that will maintain a sharp cutting edge. HSS tools will also work but they will become dull resulting in excessive edge chipping and a poor looking hole. We also recommend using high RPM's and low feed rates when using drills. This reduces the chipping around the cutout. The single most important factor though is keeping a very sharp tool.

Using a drill with a positive rake angle and thin points or split points can help reduce cutting pressure. Feed rates must also be constant and may even be reduced upon exiting from a hole to reduce flexing of the part when the drill exits. Using a solid back surface to support the part when drilling can also aid in reducing delamination and chipping. Caution on polycarbonate to not generate enough heat that the material starts to melt or string.

3. Routing. A third method is to use a router bit and router. This method produces very clean holes and cutouts but also requires the holes and cutouts to be manually laid out beforehand and a steady hand to stay within the layout lines. The use of a jig or fixture to help guide the handheld router or the use of CNC machining centers is helpful to keep straight edges and clean cutouts. The use of diamond impregnated router bits is preferred for longevity but carbide bits will work just as well. Caution on polycarbonate to not generate enough heat that the material starts to melt or string.

4. Punching. A fourth method is to use a standard hole punch similar to what you would use with metal boxes. This produces a good clean hole but can leave chipped edges if the punch is dull. Again maintaining sharp tools is essential to producing clean cutouts. A pilot hole is required before using a standard hole punch. Manual or hydraulic punch actuators can both be used with composite materials. Punching is not recommended on polycarbonate.

Technical Information

SOLARGUARD®

A non-halogenated fiberglass system that beats the effects of outdoor exposure plus provides the chemical and flame resistance you've come to expect from Robroy Enclosures!

SolarGuard®, in extensive comparison testing, outperformed other available SMC formulations by as much as 60% in its ability to retain gloss and color after exposure to concentrated UV light.

SolarGuard® maintained stability in thickness proving that its physical properties remain very much intact despite EMMAQUA testing that concentrates natural sunlight using 10 highly reflective mirrors to create an intensity level of approximately 8 suns!

SolarGuard® meets a NFPA No. 101 Class A flame spread index. Fire retardancy, achieved through use of alumina trihydrate fillers, meets UL 94 5V standards.

SolarGuard® is a non-halogenated system...meaning that it contains no bromine and no antimony, thereby reducing the risk of smoke-borne toxicity.

SolarGuard® requires less maintenance than paint, wax or gel-coat alternatives used to prolong the life of electrical enclosures in outdoor environments.

How Does SolarGuard® Do What It Does?

SolarGuard's® patented double-protection formula was developed in AttaBox's FormRight lab.

Due to its chemical composition and other additives, SolarGuard® is able to reduce the effects of UV degradation such as surface roughening and fiber blooming.

How does SolarGuard® achieve this level of performance?

SolarGuard® features proprietary double-protection formulation technology that significantly enhances the molecular bond strength and crosslinking that occurs during the curing process in thermosetting polyester sheet molding compounds (SMC). Robroy's SolarGuard® system fights polymer degradation by making it much more difficult for UV light to attack molecular bonds of both primary chains and crosslinks.

A special UV Absorber is added to the SolarGuard® formulation which acts to absorb UV energy, then to release it without damaging the polymer chain. The neo-pentyl glycol (NPG) isophthalic based resin system of SolarGuard® ensures UL 94 5V fire retardancy, but provides a much stronger bond of the polymer chain resulting in significantly improved weathering resistance.

As the standard SMC formulation for most Robroy fiberglass electrical products, SolarGuard® provides an unsurpassed level of UV resistance, fire retardancy, chemical resistance and safe, durable performance...all without adding cost to Robroy's world class electrical enclosures.

How SolarGuard® Benefits You!

AT A GLANCE: DOUBLE PROTECTION THAT WORKS!

1.) THE SOLARGUARD® WAY

The SolarGuard® formulation is a neo-pentyl glycol (NPG) isophthalic based resin system that contains no bromine. Therefore, there are no weak links in the polymer chain making the UV energy required to break these links significantly greater. The result? SolarGuard® SMC material provides much better UV weathering characteristics. Fire retardancy requirements are still achieved and maintained via fillers that meet UL 94 5V standards.

2.) THE SOLARGUARD® WAY

The special UV absorber is also added into SolarGuard® and works to absorb UV energy and release it without damaging the polymer chain. This is achieved by absorbing UV energy and emitting the light at a different wavelength and frequency than that of the electrons in the carbon-carbon bonds. This prevents the polymer bonds from breaking apart. This material will also absorb UV energy more readily than the links of the polymer chain thus providing increased protection of the polyester material and increased resistance to the damaging effects of UV radiation.

THE SOLARGUARD® DIFFERENCE

- Between a 32-and-60 % improvement, compared to other SMC formulations, in its ability to retain gloss and color after exposure to concentrated UV light.
- Material thickness remains very stable, demonstrating that the physical properties of SolarGuard® are still very much intact after rigorous testing.
- Excellent chemical resistance in both exposed vapor and total submersion applications.
- ASTM flame spread testing meets a NFPA No. 101 Class A (I) Flame Spread Index.
- Potential toxic emissions have been eliminated or substantially reduced from elimination of materials such as bromine, tin and antimony. Other acid gasses have been reduced or eliminated along with significant reductions of black smoke when burned. This formulation is considered to be non-halogenated.

Technical Information

A unique SMC system for maximizing polymer chain and crosslink bonding.
 Up to 60% more UV-resistant compared with other available formulations.
 Meets UL 94 5V Fire-Retardancy Standards plus NFPA No. 101 Class A Flame Spread Index.
 Eliminates toxic bromine and antimony.
 Available to you at NO additional finished-product cost.

Proof Through Performance

Physical Properties of SolarGuard®

MATERIALS TYPICAL PROPERTIES	TEST METHOD ASTM	SOLARGUARD POLYESTER FIBERGLASS (SMC)
Flexural Strength (psi)	D 790	17K

SolarGuard® Flame Spread Classification Per NFPA No 101 ASTM E162 Surface Flammability Of Materials

CLASS	RANGE	TYPE	SOLARGUARD TEST RESULTS
Class A (I)	0 to 25	Flame Spread	Robroy SolarGuard flame spread index 20.59
Class B (II)	26 to 75	Flame Spread	
Class C (III)	76 to 100	Flame Spread	

SolarGuard® optical Density Test Result Summary ASTM E662 Specific Optical Density Of Smoke Generated By Solid Material

	NON-FLAMING	FLAMING
Ds @ 1.5 min. (avg)	0.0	0.3
Ds @ 4.0 min. (avg)	0.0	9.9
Dm (corr) (avg)	10.8	181.9

Testing Procedures Used To Ensure That SolarGuard® Meets Or Exceeds All Relative Industry Standards

- UL 746 C Polymeric Materials Used In Electrical Equipment Evaluations
- UL 50 Enclosures For Electrical Equipment
- UL 508 Industrial Control Panels.

Additional tests have been performed above and beyond these industry guidelines to aid in providing the end user with a premium product for a broad range of uses. These tests were performed using ASTM standards and other government approved procedures. Test standards and evaluation criteria are:

- Chemical resistance testing (submerged and vapor), 37 various chemicals (acids, bases)
- ASTM E162 Flame Spread
- ASTM E662 Smoke Density
- Particulate dust weight (NIOSH 05000), Acid gases HBr, HCl, HNO₃, HPO₄, H₂SO₄ (NIOSH 7903), Cyanide (NIOSH 7904), Metals (NIOSH 7300), VOC's with TIC's (EPA TO-14/TO-15), PAH (NIOSH 5506), Carbon Monoxide, Carbon Dioxide, Visual Fiberglass (NIOSH 7400), Ammonia, NO, NO₂, HS₂.

Additional UV testing has been performed under the following guidelines and evaluation criteria. Exposure testing is performed in Arizona in accordance with ASTM G90-98, Spray Cycle 1 (EMMAQUA, day spray with nighttime wetting).

- ASTM G 147-96 Standard Practice for Conditioning and Handling of Non-Metallic Materials for Natural and Artificial Weathering Test
- ASTM G 90-98 Standard Practice for Performing Accelerated Outdoor Weathering of Non-Metallic Materials Using Concentrated Natural Sunlight
- ASTM D 660-93 Method for Evaluating Degree Checking of Exterior Paints
- ASTM D 2244-93 Test Method for Calculation of

Color Difference from Instrumentally Measured Color Coordinates

- ASTM E 308-96 Standard Practice for Computing the Colors of Objects by Using the CIE System
- ASTM D1729-96 Practice for Visual Appraisal of Color and Color Difference of Diffusely-Illuminated Opaque Materials
- ASTM D 661-93 Method for Evaluating Degree of Cracking of Exterior Paints
- SFTS-1 (Wash)) 92-03-30 Method of Cleaning Exposed Specimens Prior to Inspection, Method A, Washed With Deionized Water and Soft Sponge
- ASTM D 523-89 (1999) Test Method for Specular Gloss
- ASTM D 4214-89 Standard Test Methods for Evaluating the Degree of Chalking of Exterior Paint Films, Method D, Transparent Tape Method

UV correlation testing has been performed using accelerated artificial weathering devices. Tests were performed using a QUV A Fluorescent Bulb Weatherometer. The test method utilizes a QUV machine, which consists of 2 banks of 4 fluorescent lights each that emit light in the UV-A (340 nm) wavelength. This UV wavelength simulates normal outdoor sunlight. The second part of the test utilizes water vapor to simulate rain/fog. The exposure cycle consist of alternating 4 hours of UV-A at 65 degree C and 4 hours of 100% relative humidity at 50 degree C. Testing is in accordance with ASTM G154 specifications.

Glossary

Industry Acronyms and Enclosure Terms

ANCE National Standardization and Certification of the Electrical Sector Association Col. Fuentes de Tecamachalco Naucalpan de Juarez C.P. 53950, Edo. de Mexico ANCE performs standards functions in Mexico which are similar to those of ANSI in the United States and CSA in Canada.

ANSI American National Standards Institute 1430 Broadway New York, NY 10018

Arc Resistance Measures electrical-breakdown conditions. Arc resistance is measured as time, in seconds that it takes for an electrical current to arc across a distance along the insulating surface. The higher the value, the greater the resistance to break down.

ASTM American Society for Testing and Materials 100 Barr Harbor Drive Conshohocken, PA 19428

Attenuation A measure of the ability to contain or repel EMI/RFI energy.

Bonding Establishing a low impedance conducting path between conductors in an electrical system.

BTU British Thermal Unit. A measure of the amount of heat required to raise the temperature of 1 lb. of water 1°F. This unit is commonly used to rate air conditioning capacity.

CANENA Council for Harmonization of Electrotechnical Standardization of North America, harmonizes standards among Canada, Mexico and the United States.

Composite The combination of reinforcing fibers, usually glass or carbon, and a polymer resin. The fiber reinforcement provides physical properties which exceed the resin alone.

Compression Set A physical property of gasket materials, the difference between the initial height of a never compressed gasket and the same gasket after being compressed for a given time period divided by the original height and expressed as a percentage. A lower number is desirable.

Compressive Strength Describes how much weight a non-moving, specified size and shape a material can withstand before crushed. Compressive strength is measured in thousands of pounds per square inch. Higher numbers indicate stronger materials.

Conduction 1. Electrical — The flow of electrical current in a material. 2. Thermal — The transfer of kinetic energy from one molecule to another as heat flows from a hot area to a cold area.

Continuity A low impedance conducting path between conductors in an electrical system.

Convection The transfer of heat by mixing fluids, either naturally or forced as by a fan or air conditioning.

Cover The unhinged portion of an enclosure that closes an opening.

CSA Canadian Standards Association 178 Rexdale Boulevard Etobicoke, Ontario Canada M9W 1R3

dB (decibel) Unit to express the effectiveness of a material or system in reducing electromagnetic interference. If an enclosure reduces the EMI by 30 dB, the power of the interfering wave will be reduced by a factor of 1000 in passing through the enclosure. The equation for calculating attenuation in decibels is $dB = 10 \log_{10} (P1/P2)$ where P1 = power of the interference wave before it passes through the enclosure, P2 = power of the wave after it has been reduced (attenuated) by the enclosure.

Deflection Temperature Under Load (DTUL)

Measure the temperature at which a material deflects a given amount under a given load. It was developed for thermoplastic materials which soften considerably when heated. It has a relatively little value as a design figure for reinforced thermosetting polymers.

Density Is the weight of a materials per unit volume. It is measured in pounds per cubic foot (lbs./cu. Ft). Higher numbers indicate heavier materials.

Design Test Tests to confirm performance of a product designed to an applicable standard, not intended to be a production test.

Industry Acronyms and Enclosure Terms

Dielectric Strength Is an indication of the electrical strength of a material as an insulator. The specimen is placed between heavy cylindrical brass electrodes that carry electrical current. For short-term tests, the voltage is increased from zero to breakdown at a uniform rate. Breakdown by these tests means passage of sudden excessive current through the specimen; it can be verified by instruments and visible damage. The dielectric strength of an insulating material is the voltage gradient at which electric failure or breakdown occurs. The dielectric strengths of materials vary greatly with several conditions such as humidity and geometry. It is not possible to apply the standard test values directly to field use unless all conditions, including specimen dimension, are the same. Because of this, the dielectric-strength test results are of relative rather than absolute value as specification guides.

Door The hinged portion of an enclosure that closes an opening.

Electromagnetic Emission Electrical energy radiated into the environment intentionally by an antenna or incidentally by an electronic component or power equipment during a switching operation.

Electromagnetic Field Invisible fields which surround energized conductors such as wires and antennas. A field has both electric and magnetic components.

Electromagnetic Immunity The capability of an electronic component or electrical equipment to perform its intended function in the presence of external electromagnetic fields.

EMI ElectroMagnetic Interference. Randomly radiated electrical energy which varies in frequency and intensity and is coupled to electronic systems with undesirable results. Sources include power lines, high voltage equipment, switches, relays or any device that generates an electric spark or corona.

EMC ElectroMagnetic Compatibility. The ability of electronic equipment to perform its intended function in the presence of EMI and RFI disturbances without affecting proper operation.

EMP ElectroMagnetic Pulse. Interference caused by a large and sudden electrical discharge such as lightning.

Enclosure A surrounding case constructed to provide a degree of protection to personnel against incidental contact with the enclosed equipment and to provide a degree of protection to the enclosed equipment. Enclosure Type definitions describe the application and the environmental conditions for which an enclosure will provide protection.

EU European Union

Flammability 94V-0 is a rating which is used to establish the flammability of enclosure materials. It is performed by exposing a specimen of the material in a vertical position to a flame and determining if it burns and for how long it continues to burn after the flame is removed.

Flexural Strength Also known as bending strength. It describes how much of a non-moving weight can be applied before a material yields or breaks. It is measured in thousands of pounds per square inch. Higher numbers mean the material is stronger and can withstand a heavier load.

Grounding Intentionally establishing a low impedance current path between conducting materials at the same potential, not necessarily energized, of an electrical system and the earth at zero potential. Grounds are extremely critical to protect equipment and personnel from electrical shock.

Hazardous Area Area where electrical equipment is installed and ignitable flammable gases and vapors; flammable and combustible liquids; combustible dusts or ignitable fibers and flyings are or could be present. See National Electrical Code, Articles 501-505 and 511-517.

Heat Deflection Temperature The temperature at which a composite specimen begins to deflect when exposed to a prescribed load.

Heat Distortion Temperature See Heat Deflection Temperature, both terms are used.

hz, hertz The measure of frequency, defined as one cycle/sec.

IEC International Electrotechnical Commission
1 Rue de Varembei CH-1211
Geneva 20, Switzerland

Glossary

Industry Acronyms and Enclosure Terms

Indoor Locations Areas which are protected from exposure to the weather.

Impact Strength – IZOD A measure of how much energy is absorbed by the material when it is broken by a moving weight. There are many different test methods for measuring impact. IZOD is but one of these methods. IZOD is measured in foot pounds per inch of width. (This is sometimes given as foot pounds per inch of notch.) Higher numbers mean that the materials will absorb more energy before it is broken by a moving weight.

K Factor A measure of the effectiveness of a material as a thermal insulator. It represents the quantity of heat which can pass through one square foot of material in one hour for every degree Fahrenheit of temperature difference across one inch of material thickness.

Mhz, Megahertz A measure of frequency, defined as one million cycles/sec.

Mold Shrinkage Is the difference in dimensions between the cold mold and cold part.

NEC National Electric Code, an NFPA document.

NEMA National Electrical Manufacturers Association 1300 North 17th St, Suite 1847 Rosslyn, VA 22209

NFPA National Fire Protection Association 1 Batterymarch Park P.O. Box 9101 Quincy, MA 02269-9101

Non-hazardous Areas Area where electrical equipment is installed and ignitable flammable gases and vapors; flammable and combustible liquids; combustible dusts or ignitable fibers and flyings are not present. See NEC Articles 501-501 and 511-517 as well as the above definition of Hazardous Areas.

Non-ventilated Constructed so as to provide no intentional circulation of external air through the enclosure.

Ohms per Square A measurement unit for electrical continuity of the metal coating applied internally to fiberglass enclosures for EMI/RFI shielding. The surface resistance (conductivity) measurement is without units because the surface area does not influence the reading, i.e., measurements will yield the same result over 1 in², 1 cm² or 1 m².

Outdoor Locations Areas which are exposed to the weather.

Relative Permittivity Is the ratio of the capacitance of a particular material to the capacitance of air. The relative permittivity of most insulating materials varies from 2 to 10, air having 1. Higher values indicate greater insulating qualities.

RFI Radio Frequency Interference. Interference caused by radio waves which emanate from commercial radio and television stations, amateur radio broadcasts, radar, microwave ovens, etc. Radio waves are usually well defined in terms of amplitude and frequency.

Seamless Gasket The polymer gasket which is automatically dispensed and chemically reacts to form a gasket which has no seams.

SMC Sheet Molding Compound. The fiberglass-polyester material used to mold AttaBox Enclosures. The compression molding process used to make AttaBox fiberglass enclosures.

Specific Gravity Is the ratio of the density of a material to the density of water. It can be obtained by dividing a material's density in lbs/ft³ to the 3rd power by 62.36.

Specific Heat (Thermal Capacity) Defines how much heat is needed to raise the temperature of one pound of material one degree F. It is measured in BTUs per pound per degree Fahrenheit (BTU/lb/°F). Higher numbers mean that it takes more heat energy to raise the temperature of a material.

Strip Gasket The neoprene material which is cut in strips and attached to the enclosure with an adhesive.

Temperature Rise The temperature difference between air inside the enclosure and the ambient air outside the enclosure.

Industry Acronyms and Enclosure Terms

Tensile Elongation When a specified size and shape bar of a material is pulled, it gets longer. Elongation tells how much longer it gets before it breaks.

Tensile Modulus Measure of the ability of a material to withstand load without permanent deformation. It is normally measured as the slope of a the straight line portion of a plot of stress vs. strain. Is measured in millions of pounds per square inch.

Tensile Strength Describes how much of a non-moving load a material can withstand before it no longer returns to its original length upon removal of the load. Tensile strength is measured in thousands of pounds per square inch. Higher numbers indicate materials which can withstand a stronger pull before failure.

Thermal Coefficient of Expansion Measures how much the length of a material will change when the material is heated or cooled. The value given is based on the inch as a unit. The number given shows how much this materials will increase in length if the temperature of the material is raised one degree Fahrenheit (in/in/°F). Higher numbers mean that the material will expand or lengthen more for each degree rise in temperature. Smaller numbers indicate relative stability to change no matter what temperature.

Thermal Conductivity Known as the K factor. It measures the transfer of heat from one side of a material to the other side. It is measured as BTUs per hour per unit area (square feet) for a thickness of one inch and a temperature difference of one degree Fahrenheit between both sides of the material in the same amount of time.

Thermal Radiation The transfer of energy by electromagnetic waves.

Thermoplastic A polymer which becomes solid when the temperature falls below its melting point. A thermoplastic polymer, once cured, can be reheated, melted and shaped into something else.

Thermoset A polymer which is cured at a given temperature, an irreversible chemical reaction. A thermoset polymer, once cured, cannot be heated again and shaped into something else.

Torque Torque is the tendency of a force to rotate an object about an axis. Just as a force is a push or pull, torque can be thought of as a twist. The unit of measure is generally expressed in foot pounds or inch pounds.

Scarborough, Ontario
Canada M1R 3A9

UV Ultraviolet Light. The component of sun light above the visible spectrum that affects polymer materials in long term exposures.

Ventilated Constructed so as to provide for the circulation of external air through the enclosure to remove excess heat, fumes, or vapors.

Volume Resistivity Is the electrical resistance between opposite faces of a unit cube (1 cm to the 3rd power) of a given material. This resistance is expressed in ohms. Higher values indicate greater insulating qualities.

Water Absorption A physical property of materials. A specimen of the material is weighed, placed in water for 24 hours and reweighed. The difference between the initial weight and the weight after water exposure is expressed as a percentage.
