# Roller Chains

## Description of Roller Chain Parts

## Chain Dimensions

Principal dimensions of roller chain which identify the chain definitely are pitch, roller width, roller diameter and pin diameter.

**PITCH** is the linear distance from center to center of adjacent pins or rivets.

**WIDTH** is the distance between inside plates or length of roller.

**DIAMETER** is the actual outside diameter of roller (or pin).

## Chain Types

Boston Roller chains can be furnished in two types — RIVETED and DETACHABLE.

### RIVETED TYPE

Riveted type chains are recommended for high speed drives, as a greater rigidity of the pins and side plates is secured from this construction.

Riveted type is considered standard on the smaller sizes up to and including 3/4" pitch and will be supplied unless Detachable type is specified. Detachable type chain is not recommended up to and including 5/8" pitch, but is available in cotter pin construction in 3/4" pitch.

### DETACHABLE (Cotted) TYPE

Detachable type chains are recommended for slower speed drives, especially in the larger pitches where ease of assembly and disassembly becomes an important factor.

Detachable type with cotter pins is considered standard on all sizes 1" pitch and above and will be supplied unless riveted type is specified. Both types are available.

## Chain Links

### CONNECTING LINK (Spring Clip)

Standard for Nos. 25, 35, 40, 41, 50 and 60 single and multiple-width chains.

### CONNECTING LINK (Cotter Pin)

Standard for Nos. 80, 100, 120, 140, and 160, 200 and 240 single and multiple-width chains.

### ROLLER LINK

Furnished as complete assemblies, roller links are standard for all chain sizes. The same roller links are used for single and multiple-width chains.

### ONE PITCH OFFSET LINK (For standard service)

For use whenever chain length contains an odd number of pitches. These links are standard for all chain sizes in single or multiple-widths. (Not available for 25 pitch.)

### TWO PITCH OFFSET LINK (For severe service)

Consists of a roller link and an offset link riveted together. Two pitch offset assemblies should be specified for severe service.

## Ordering Information

## Conveyor Chain Selection

### Single or Double Pitch, Flat-Top and Hollow Pin Chain

In order to select a chain for a conveyor application, the Velocity and maximum Chain Pull must be established. The total pull may be obtained if the Torque and Sprocket PD are known, or if the Horsepower and Velocity can be determined.

$$\text{Chain Pull, } W = \frac{2T}{D}$$

$$W = \frac{33000 P}{V}$$

$$W = \frac{126050 P}{nD}$$

$W$  = Chain Pull, Lbs.  
 $T$  = Torque, In. Lbs.  
 $D$  = Sprocket PD, Inches  
 $P$  = Horsepower  
 $V$  = Chain Velocity, FPM  
 $n$  = Sprocket Speed, RPM

If a pair of chains are used, the pull on each chain will be half of the total chain pull.

Having determined the Chain Pull, refer to Chain Load Rating Charts on Page 247 and select a chain with a capacity equal to or greater than the Chain Pull Required.

To Calculate Chain Length (L):

For Single Pitch Chain

$$L = 2C + N$$

For Double Pitch & Flat-Top Chain

$$L = 2C + \frac{N}{2}$$

where:

$L$  = Chain Length, Pitches  
 $C$  = Center Distance, Pitches  
 $N$  = Number of Teeth in One Sprocket\*

The computed value of  $L$  must be rounded out to a larger whole number of pitches (links) for each complete chain. Any whole number of links is satisfactory for Hinge-Top Chain but an even number should be selected for Single or Double Pitch or Flat-Top Chains.

To obtain the center distance or chain length in inches, the value in pitches should be multiplied by the chain pitch.

**Example 1.** Selecting a Double Pitch Conveying Chain.

The power required to move material at 50 FPM is 1 Horsepower on a Conveyor with a Center Distance of 10 ft.

Step I: Determine Chain Pull:

$$W = \frac{33,000 P}{V} = \frac{33000 \times 1}{50} = 660 \text{ Lbs.}$$

Step II: Refer to Conveyor Chain Load Rating Chart, page 165. Select a double pitch chain with a Working Load equal to or greater than 660 lbs. at 50 FPM. Selection — C2050 (1.25" Pitch) with 5/8 pitch sprockets 50B25 (or larger).

Step III: Determine Chain Length in Pitches. Convert Center Distance (10 feet) to pitches.

$$C = \frac{10 \times 12}{1.25} = 96 \text{ Pitches}$$

$$\text{Chain Length (L)} = 2C + \frac{N}{2}$$

$$\text{Chain Length (L)} = 2 \times 96 + \frac{25}{2} = 204.5$$

Adjust to next larger even whole number.  
Chain Length (L) = 206 Pitches

\*Assuming same size Driver and Driven Sprockets.

### Single Pitch & Double Pitch Chain

For horizontal conveyor applications where the HP or Torque data is not available, the approximate Chain Pull can be calculated from the Weight to be moved (product and chain) and the Coefficient of Friction (between sliding surfaces of chain and supporting ways).

For Normal operation:

Chain Pull

$$W = (M + 2m) Cf$$

$W$  = Chain Pull Lbs.

$M$  = Product Weight, Lbs. per Ft.

$m$  = Chain Weight, Lbs. per Ft.

$C$  = Conveyor Length (between Centers), Ft.

$f$  = Coefficient of Friction (see Table).

For trial purposes,

let  $m = 1.0$  for other conveyor chains.

**Note:** The estimated weight of pins and/or attachments (per foot of chain) should be included in chain weight.

Whenever the product becomes stalled on a moving conveyor, the chain pull is increased. The Added Pull depends on the Stalled Weight (of product) and the Coefficient of Friction (between surfaces of product and chain).

For stalled product:

Added Chain Pull,

$$w = Mlf$$

$w$  = Added Chain Pull, Lbs.

$M$  = Product Weight, Lbs. per Ft.

$l$  = Length of Stalled Product, Ft.

$f$  = Coefficient of Friction (see Table).

For Stalled condition:

Total Chain Pull =  $W + w$ , Lbs.

If a pair is used, the pull on each chain will be half of the total chain pull.

## Conveyor Chain Selection (Continued)

**Example 2.** A horizontal conveyor 25 Ft. long is to move a product weighing 200 Lbs. per Ft. at 20 FPM. Two FT2060 Flat-Top chains will be used, if possible, with the thermoplastic plates supported on metal ways without lubrication.

Chain Pull,

$$W = (M + 2m) Cf$$

$$M = 200 \text{ Lbs. per Ft.}$$

$$m = 1.41 \times 2 = 2.82 \text{ (two chains)}$$

$$C = 25 \text{ Ft.}$$

$$f = .25 + .15 = .40 \text{ (for starting with load)}$$

$$W = (200 + 5.64) 25 \times .40 = 2056 \text{ Lbs.}$$

The maximum working load of FT2060 chain at 20 FPM is 1170 Lbs. (see table) and this will be adequate if the product cannot become stalled.

**Note:** Whenever two strands of chain are used, the total chain weight will be double the single strand weight, (per foot).

### COEFFICIENT OF FRICTION FOR CONVEYOR CHAIN

**SINGLE PITCH ROLLER CHAIN WITH ATTACHMENTS**

**DOUBLE PITCH ROLLER CHAIN WITH ATTACHMENTS**

To select the proper chain, the working load or chain pull and the chain speed in feet per minute must be known. Using this information find the proper chain in the chart.† These load ratings are based on proper installation, lubrication and steady load conditions.

The minimum permissible number of sprocket teeth is 15 for single pitch, and 24 for double pitch chain. For smoother operation, sprockets with greater numbers of teeth than the minimum are recommended.

### CHAIN LOAD RATING CHART

Single Pitch	Chain Numbers							
	35*	40	50	60	80	100	120	160

300	110	195	305	440	780	1220	1760	3120
Standard Pitch Boston Sprockets To Operate With Above Chain								
Pitch	3/8"	1/2"	5/8"	3/4"	1"	1-1/4"	1-1/2"	2"

\*No. 35 Chain is a Rollerless Chain.

†For Hollow Pin chains, the working load (chain pull) should be multiplied by 1.3 to obtain the proper value for use in selecting the chain pitch required.

### Flat Top Conveyor Chain

#### MAXIMUM WORKING LOAD OR CHAIN PULL (LBS.)

Chain Type	Chain Velocity — Feet Per Minute					
	0-10	20	30	40	50	70
FT2060	1070	1045	1035	1030	1025	1015

#### MAXIMUM WORKING LOAD OR CHAIN PULL (LBS.)

Chain Type	Chain Velocity — Feet Per Minute					
	100	150	200	250	300	400
FT2060	1005	960	915	855	670	435

**LUBRICATION** - To assure maximum chain life, carbon and stainless steel chains should be lubricated wherever possible. Soap lubrication is recommended. Several detergent and nonalkali fluid types are on the market. Water lubrication should be used when no other lubricant can be tolerated. Drip-type systems and wheel-type and sponge-type applicators are on the market.

Delrin chain tends to be self-lubricating, although wear life can be extended with the use of a lubricant, such as soap and water.

## Conveyor Chain Working Load

At speeds of normal conveyor operation (less than 500 feet per minute), chains are selected on the basis of safe working load, rather than horsepower capacity. Working load or chain pull of conveyor series chains is calculated by multiplying the total combined weight of the chain, plus the conveyed material in any run, by the appropriate coefficient of friction. In general, the maximum working load for a conveyor chain will be higher than that

determined for similar chains from a horsepower rating table. The higher load is permitted because there are usually fewer load cycles on a conveyor chain, compared to a power transmission drive. In order to minimize wear, permissible working loads of conveyor chains are reduced as speeds increase. See the working load table below.

### COEFFICIENT OF FRICTION – DOUBLE PITCH ROLLER CHAINS

Chain Number	Chain with Large Size Rollers and Rolling Friction				Chain with Standard Size Rollers and Sliding Friction			
	*Static		Rolling		*Static		Sliding	
	Dry	Lubricated	Dry	Lubricated	Dry	Lubricated	Dry	Lubricated

C-2120H, C-2122H	3	4855	4815	4690	4495	4250	3090	2125	1480	1065
C-2160H, C-2162H	4	8585	8210	8000	7670	7250	5275	3625	2520	1815

Calculate the working load for horizontal, inclined, vertical and carousel conveyors, substituting the following values in the appropriate formulas:

- P = Chain pull or working load
- S = Speed in feet per minute
- L = Length of conveyor in feet between sprocket centers
- T = Total chain length in feet
- V = Vertical rise in feet
- F<sub>1</sub> = Coefficient of friction, sliding
- F<sub>2</sub> = Coefficient of friction, rolling
- W = Weight of chain and attachments per foot in pounds
- M = Weight of conveyed product per foot in pounds
- N = Number of chain strands

### Horizontal Conveyor

$$P = \frac{LF(2W + M)}{N}$$

### Inclined Conveyor

A factor must be added to or subtracted from the chain load to compensate for raising or lowering the conveyed load on an inclined installation. This factor may be calculated by multiplying the weight of conveyed load by the vertical change in feet, and dividing by the horizontal run of the conveyor in feet.

$$P = \frac{LF(2W + M) \cos \phi \div LM \sin \phi}{N}$$

$$\phi = \text{ARC tan } \frac{V}{L_1}$$

### Vertical Conveyor

$$P = \frac{L(M + W)}{N}$$

### Carousel Conveyor (Plan View) for Crescent Top Chains

$$P = \frac{TF(W + M) + (TMF)}{N}$$

Note: (TMF) is the length of stalled product.

## Roller Chain Formulas

### Horsepower

Horsepower equals 33,000 foot-pounds per minute, or 550 foot-pounds per second. In terms of chain working load or pull (P) and speed:

$$HP = \frac{P \times S}{33,000}$$

$$HP = \frac{P \times \text{Number of Teeth} \times \text{Pitch} \times \text{RPM}}{396,000}$$

$$HP = \frac{\text{Torque (lb.-in.)} \times \text{RPM}}{63,025}$$

$$HP = \frac{\text{Torque (lb.-in.)} \times \text{RPM}}{5,252}$$

### Ratio

$$\text{Ratio} = \frac{\text{Teeth in Large Sprocket}}{\text{Teeth in Small Sprocket}} \quad \text{or} \quad \frac{\text{Fast RPM}}{\text{Slow RPM}}$$

### Chain Working Load

When horsepower input is known, calculate for chain working load or pull (P):

$$P = \frac{HP \times 33,000}{\text{FPM}}$$

$$P = \frac{HP \times 396,000}{\text{Number of Teeth} \times \text{Pitch} \times \text{RPM}}$$

$$P = \frac{\text{Torque}}{\text{Sprocket Pitch Radius}}$$

### Chain Speed

$$\text{Speed (FPM)} = \frac{\text{Pitch} \times \text{Number of Teeth} \times \text{RPM}}{12}$$

### Sprocket Speed

$$\text{RPM} = \frac{12 \times \text{RPM}}{\text{Number of Teeth} \times \text{Pitch}}$$

$$\text{RPM of Driven Sprocket} = \frac{\text{Driver Teeth} \times \text{Driver RPM}}{\text{Driven Teeth}}$$

$$\text{RPM of Driver Sprocket} = \frac{\text{Driven Teeth} \times \text{Driven RPM}}{\text{Driver Teeth}}$$

### Centrifugal Pull or Tension

Pull or tension caused by chain weight and velocity:

$$\text{Centrifugal Pull} = \frac{\text{Chain Weight per Foot} \times (\text{FPM})^2}{115,900}$$

### Total Chain Tension

Total Chain Tension = Working Load + Centrifugal Pull

### Chain Bearing Pressure

$$\text{Bearing Pressure (pounds per square inch)} = \frac{\text{Working Load}}{\text{Bushing Length} \times \text{Pin Dia.}}$$

### Torque

Torque = Sprocket Pitch Radius x Working Load

$$\text{Torque (lb.-in.)} = \frac{HP \times 63,025}{\text{RPM}}$$

$$\text{Torque (lb.-ft.)} = \frac{HP \times 5,252}{\text{RPM}}$$

### Factory of Safety

$$FS = \frac{\text{Chain Ultimate Strength}}{\text{Chain Working Load}}$$

## Ordering Procedure

Attachments may be ordered as separate links or assembled in chains.

**WHEN ORDERING SEPARATE ATTACHMENT LINKS, THE FOLLOWING DATA MUST BE GIVEN:**

1. Chain Number and Attachment Number.
2. Connecting Link or Roller Link.

**WHEN ORDER ATTACHMENTS ASSEMBLED\* IN CHAIN, THE FOLLOWING INFORMATION MUST BE SUPPLIED:**

1. Chain Number and Attachment Number.
2. Spacing between Attachment Centers (Pitches or Inches). This must be a multiple of the chain pitch.
3. If spacing is an even number of pitches, attachments will be assembled as pin links unless roller link style is specified.
4. If spacing is an odd number of pitches, assembly will normally be supplied with alternate pin and roller link attachments. For attachments to be on pin (or roller) links only, an offset link must be assembled in each interval.

\*Riveted assembly will be supplied unless detachable links are specified.

# Roller Chains

## Hollow Pin

### Single and Double Pitch

Boston Gear Hollow Pin Chain is identical to ANSI Roller Chain in pitch, roller width and roller diameter. It is quality designed for long wear life in conveyor applications. The “hollow pin” feature provides unlimited conveyor design versatility. Stud, bushed design. Bushing diameter is same as comparable roller chain.

## Leaf (Cable) Chain

Boston Leaf Chains are designed for tension linkage applications such as counterweight chains for machine tools, elevator and oven doors, fork lift truck masts, spinning frames, i.e. applications to lift or pull where it is not necessary to engage a sprocket.

Leaf chains normally run over sheaves and are attached to clevises at each end. Because of the wide variation in clevis designs, leaf chains are furnished less the end pins.

Not recommended for new applications.

### STANDARD LACING TABLE

2 x 3

3 x 4

4 x 6

When ordering chain with odd number of pitches specify whether male or female end link required.

# Ladder Chain

## Steel–Stainless Steel–Brass

An effective, low-cost means of transmitting motion where load (torque) is not a critical factor.

In addition to stock-listed sizes and materials, ladder chain can be furnished pre-assembled into endless lengths to customer specifications or pre-cut to desired lengths.

Ladder chain may be made into endless loops by opening the two eyes of one end link with needle-nosed pliers to permit entry of the other end link and then closing the open eyes.

Ladder chain can be furnished on a made-to-order basis made endless, with special plating. Consult the factory for prices.
